**EMI TEST REPORT
for
CERTIFICATION to
FCC PART 90**

FCC ID: S490806SSR02

Test Sample: Slope Stability Radar

Model:

Tested for: GroundProbe Pty Ltd

Report Number: Report M060753_Cert_Tx

Issue Date: 24th July 2006

EMC Technologies Pty Ltd reports apply only to the specific samples tested under stated test conditions. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. EMC Technologies Pty Ltd shall have no liability for any deductions, inferences or generalisations drawn by the client or others from EMC Technologies Pty Ltd issued reports. This report shall not be used to claim, constitute or imply product endorsement by EMC Technologies Pty Ltd.

The tests, calibrations or measurements covered by this document have been performed in accordance with NATA requirements which include the requirements of ISO/IEC 17025 and are traceable to national standards of measurement. This document shall not be reproduced, except in full.

EMI TEST REPORT FOR CERTIFICATION to FCC PART 90

1 INTRODUCTION

This report details the results of RF tests and measurements performed on the Slope Stability Radar (SSR).

Test results were obtained using procedures in accordance with the following Federal Communications Commission (FCC) standards/regulations:

The test sample **complied** with the requirements of:

1.1 Summary of Results

FCC Part 90,	Test Performed	Result
2.1046	Power Output	Noted
2.1047	Modulation	Complied
2.1049	Bandwidth	Complied
2.1051	Spurious	Complied
2.1053	Spurious	Complied
2.1055	Stability	Complied
2.1057	Frequency Range	Noted
2.202	Bandwidths	Noted

The measurement procedures used were in accordance with ANSI C63.4-2003 and OET Bulletin No. 65. The instrumentation conformed to the requirements of ANSI C63.2-1996.

1.2 Modifications by EMC Technologies

No modifications were required.

2 GENERAL INFORMATION

2.1 Test Sample Description (as supplied by Client)

The sample tested has the following specifications:

- a. Mean Transmitter Power: 60 mW
- b. Peak Transmitter Power: 60 mW
- c. Pulse Width: 2.884 seconds
- d. Pulse Repetition Frequency: 107.107 kHz
- e. Antenna Gain: 46 dBi
- f. Maximum EIRP: 25.8 dBW
- g. Lowest generated RF: 107.107 kHz
- h. Power Supply: 12V DC batteries charged intermittently by diesel generator.
Universal AC input battery charger for backup.
- i. Temperature: -26 degrees to 55 degrees Centigrade

Refer to Appendix C for further details.

2.2 Test sample configuration

The SSR-X was transmitting continuously during the tests.

Testing was performed with the SSR-X rotated around 3 orthogonal planes. The worst-case results are reported.

Refer to Appendix B - Test Setup Photographs.

2.3 Test Sample Block Diagram

Refer to Appendix C – Test Sample Block Diagram

2.4 Test Procedure

Emissions measurements were performed in accordance with the procedures of ANSI C63.4-2003. Radiated emissions tests were performed at a distance of 3 and 10 metres from the EUT.

2.5 Test Conditions

The SSR-X was tested with the following test conditions:

- a. Standard Temperature and Humidity
 - i. Temperature: $+25^{\circ}\text{C} \pm 4^{\circ}$ maintained.
 - ii. Relative Humidity: $60\% \pm 10\%$ observed.
- b. Standard Test Power Source
 - i. Standard Test Voltage: 12.9 Vdc.
- c. Extreme Temperature
 - i. High Temperature: $+ 55^{\circ}\text{C}$ maintained.
 - ii. Low Temperature: $- 26^{\circ}\text{C}$ maintained.
- d. Extreme Voltage Conditions.
 - i. Extreme High Supply Voltage 14.8 V dc.
 - ii. Extreme Low Supply Voltage 11.0 V dc.

2.6 Test Facility

2.6.1 General

Radiated Emission measurements were performed at EMC Technologies open area test site (OATS) situated at Lerderderg Gorge, near the township of Bacchus Marsh in Victoria, Australia. Bandwidth and other conducted RF measurements were performed at EMC Technologies' laboratory in Tullamarine, (Melbourne) Victoria Australia.

The above sites have been fully described in a report submitted to the FCC office, **FCC Registration Number 90560**.

2.6.2 NATA Accreditation

EMC Technologies is accredited in Australia to test to the following standards by the National Association of Testing Authorities (NATA).

“FCC Part 15 unintentional and intentional emitters in the frequency range 9kHz to 18 GHz excluding TV receivers (15.117 and 15.119), TV interface devices (15.115), cable ready consumer electronic equipment (15.118), cable locating equipment (15.213) and unlicensed national information infrastructure devices (Sub part E).”

The current full scope of accreditation can be found on the NATA website: www.nata.asn.au It also includes a large number of emission, immunity, SAR, EMR and Safety standards. NATA is the Australian national laboratory accreditation body and has accredited EMC Technologies

to operate to the IEC/ISO17025 requirements. A major requirement for accreditation is the assessment of the company and its personnel as being technically competent in testing to the standards. This requires fully documented test procedures, continued calibration of all equipment to the National Standard at the National Measurements Laboratory (NML) and an internal quality system to ISO 9002. NATA has mutual recognition agreements with the National Voluntary Laboratory Accreditation Program (NVLAP) and the American Association for Laboratory Accreditation (A2LA).

2.7 Units of Measurements

Conducted Emissions

Measurements are reported in units of dB relative to one microvolt. (dB μ V).

Radiated Emissions

Measurements are reported in units of dB relative to one microvolt per metre (dB μ V/m).

2.8 Test Equipment Calibration

All measurement instrumentation and transducers were calibrated in accordance with the applicable standards by an independent NATA registered laboratory such as Agilent Technologies (Australia) Pty Ltd or the National Measurement Laboratory (NML). All equipment calibration is traceable to Australia national standards at the National Measurements Laboratory. The reference antenna calibration was performed by NML and the working antennas (biconical and log-periodic) calibrated by the NATA approved procedures. The complete list of test equipment used for the measurements, including calibration dates and traceability is contained in Appendix A.

2.9 Ambients at OATS

The Open Area Test Site (OATS) is an area of low background ambient signals. No significant broadband ambients are present however commercial radio and TV signals exceed the limit in the FM radio, VHF and UHF television bands. Radiated prescan measurements were performed in the shielded enclosure to check for possible masked radiated emissions at the frequencies where the OATS ambient signals exceeded the test limit.

3 RF MEASUREMENTS

3.1 Power Output, Section 2.1046

The mean conducted RF power output of the radar module (under normal pulse radar operation) was measured using a spectrum analyser.

Measurements were made with the input voltage set to 12.9 V DC and when varied by $\pm 15\%$. Testing was carried out at maximum power output.

Frequency (GHz)	Battery Voltage (V dc)	Rated Power (dBm)	Temperature (°C)	Measured Power (dBm)
9.5525	12.9	14.77	-26	14.44
9.5525	14.8	14.77	-26	14.48
9.5525	11.0	14.77	-26	14.28
9.5525	12.9	14.77	55	12.76
9.5525	14.8	14.77	55	12.68
9.5525	11.0	14.77	55	12.68

Limits:

Clause 90.205(m) of Part 90 specifies that in the maximum allowable effective radiated power will be determined on case by case basis for transmitters not in defined bands.

Result: Noted.

Measurement Uncertainty: ± 0.5 dB

3.2 Modulation Characteristic, Section 2.1047

The duty cycle for the demodulated output is derived from the measured demodulated output of the radar.

The Pulse Width measured was 2.884ms.

The calculated duty cycle for the demodulated output of the radar was 98.77%

Result: Complied.

Measurement Uncertainty: +0.5dB

3.3 Occupied Bandwidth, Section 2.1049

The 99% effective bandwidth (EBW) of the radar module only (under normal pulse radar operation) was measured using a spectrum analyser with a 99% bandwidth function (Resolution bandwidth (RBW) was set to 1 MHz).

Figure 1 Configuration -Occupied Bandwidth Test

Span (MHz)	Resolution Bandwidth (MHz)	Video Bandwidth (MHz)	99% Bandwidth (MHz)	Attenuation (dB)	Graph No.
500	1	0.3	95	0	4
200	1	0.3	96.5	0	5
150	1	0.3	95.3	0	6

Limit: 105MHz

Result: Complied.

Measurement Uncertainty: 5%

3.4 Conducted Spurious Emissions, Section 2.1051

The conducted spurious emissions were measured using Rohde and Schwarz ESIB-40 connected to the antenna port of the radar. The resolution bandwidth settings were:

9-150 kHz:	300 Hz RBW
150kHz-30 MHz:	10 kHz RBW
30-1000 MHz:	100 kHz RBW
1-40 GHz:	1 MHz RBW

The permissible spurious levels are:

Frequency Range (MHz)	Limit (dBm)	Limit (dBuV)
0.09-30	-13	94
30-9500	-13	94
10000-40000	-13	94

All spurious results measured were > 20dB lower than the permissible levels.

Figure 2 Test Configuration – Conducted Spurious Emissions Test

Graphical results are depicted in Graphs 1-4,13-14.

Result: Complied

Measurement Uncertainty: $\pm 1\text{dB}$

3.5 Frequency Stability, Section 2.1055

A spectrum analyser (Span and RBW as required to yield adequate marker frequency counter resolution) was used to measure the frequency stability of the carrier frequency, over temperature and supply voltage.

The temperature range was set between -26°C to $+55^\circ\text{C}$. The primary voltage range was 85 % to 115% of nominal. This correlated to the input DC power supply being varied from 11.0V to 14.8V (12.9VDC nominal).

Note: The frequency stability must be adequate to ensure that emissions remain within the Authorized Band (9,500-10,000 MHz) over the specified temperature and voltage variations.

Figure 3 Test Configuration – Frequency Stability Test

Temperature $^{\circ}\text{C}$	DC Input Voltage (11V)		DC Input Voltage (12.9V)		DC Input Voltage (14.8V)	
	F_L^1 (GHz)	F_H (GHz) ²	F_L (GHz)	F_H (GHz)	F_L (GHz)	F_H (GHz)
-26	9.505	9.600	9.5046	9.600	9.5046	9.600
-15	9.5047	9.600	9.5046	9.600	9.5047	9.600
-5	9.5046	9.600	9.5046	9.600	9.5047	9.600
5	9.499	9.600	9.5046	9.600	9.5047	9.600
15	9.499	9.600	9.5046	9.600	9.5049	9.600
25	9.505	9.600	9.5046	9.600	9.5046	9.600
35	9.505	9.600	9.5046	9.600	9.5046	9.600
45	9.504	9.600	9.5046	9.600	9.5046	9.600
55	9.505	9.600	9.5046	9.600	9.5046	9.600

Result: Complies

Measurement Uncertainty: $\pm 2.83\text{MHz}$

¹ F_L denotes lowest extremity of the lower band of the transmission envelope

² F_H denotes lowest extremity of the upper band of the transmission envelope

4 RADIATED EMISSION MEASUREMENTS

4.1 Test Procedure

Testing was performed in accordance with the requirements of FCC Part 90.

4.2 Calculation of Peak and Average Field Strength

The peak field strength was calculated automatically by the software using all the pre-stored calibration data. The method of calculation is shown below:

$$E = V + AF - G + L \quad \text{Where:}$$

E = Radiated Peak Field Strength in dB μ V/m.
V = EMI Receiver Voltage in dB μ V. (measured value)
AF = Antenna Factor in dB(m⁻¹). (stored as a data array)
G = Preamplifier Gain in dB. (stored as a data array)
L = Cable loss in dB. (stored as a data array of Insertion Loss versus frequency)

- **Example Peak Field Strength Calculation**

Assuming a receiver reading of 34.0 dB μ V is obtained at 90 MHz, the Antenna Factor at that frequency is 9.2 dB. The cable loss is 1.9 dB while the preamplifier gain is 20 dB. The resulting Field Strength is therefore as follows:

$$34.0 + 9.2 + 1.9 - 20 = 25.1 \text{ dB}\mu\text{V/m}$$

4.3 Relation between field-strength and E.I.R.P.

The field strength emission limits are converted to an E.I.R.P. level in dBm using the following equation:

$$E.I.R.P. (dBm) = E_0(dB(uV/m) + 20 \log_{10} D(m) - 104.8 \quad (1)$$

taken from section 2 of the NTIA document Assessment of Compatibility between Ultrawideband Devices and selected Federal systems, NTIA Special Publication 01-43, where

E.I.R.P. = E.I.R.P. corresponding with the electric field strength E_0 (in dBm)
 E_0 = electric field strength (in dB(uV/m))
 D = reference measurement distance (in meters).

Note: free-space propagation is assumed.

4.4 Radiated Spurious, Section 2.1053

The radiated field strength of spurious emissions (under normal pulse radar operation) was measured using a Rohde and Schwarz ESIB-40 receiver connected to a calibrated antenna. The radar module, transmitter cable and antenna was set up on an Open Area Test Site in accordance with ANSI C63.4-2003.

Limit:

Part 2.1051 states that emissions greater than 20 dB below the limit need not be specified.

Part 2.1057 states that the spectrum should be investigated up to the 10th harmonic if the transmitter operates below 10 GHz. Testing was performed up to 40GHz.

Based on an EIRP limit of -13dBm the equivalent E-field at 3m is:

$$E_0(dB(uV/m)) = -13dBm - 20 \log 3 + 104.8 = 82.3 \text{ dB}\mu\text{V/m}$$

If the initial measured field strength levels are more than 20dB below the 3 meter field strength limits equivalent to the EIRP limit, then the FCC does not demand the continuation of measurements by means of the substitution method. (Refer to FCC OET Website Publication number 213318).

Frequency MHz	Polarisation	Peak Level Measured dB μ V/m	*Calculated Peak Limit dBuV/m	Δ Peak $\pm$ dB
2844.32	Horizontal	51.3	82.3	-31.0
2754.50	Horizontal	49.7	82.3	-32.6
1970.06	Vertical	48.6	82.3	-33.7
1820.36	Vertical	48.3	82.3	-34.0
1808.39	Horizontal	46.8	82.3	-35.5

Result : The highest radiated field strength emission complied with FCC limit by a margin of 31dB at 2844.32 MHz. Refer to Appendix D, graphs 7 to 12.

Conclusion: Complied.

Measurement Uncertainty: ± 3.7 dB

5 COMPLIANCE STATEMENT

The Slope Stability Radar, Model:, tested on behalf of Groundprobe Ltd, complied with the requirements of 47 CFR, Part 90 - Rules for Radio Frequency Devices (intentional radiators).

Results were as follows:

FCC Part 90,	Test Performed	Result
2.1046	Power Output	Noted
2.1047	Modulation	Complied
2.1049	Bandwidth	Complied
2.1051	Spurious	Complied
2.1053	Spurious	Complied
2.1055	Stability	Complied
2.1057	Frequency Range	Noted
2.202	Bandwidths	Noted
