1 JOB DESCRIPTION

1.1 General Information

Applicant Name / Address:	Technology Solutions (UK) Ltd. Suite C, Loughborough Technology Center Leicestershire, UK LE11 3GE United Kingdom
Name of contact:	David R. Evans
Telephone:	011 44 1509220022
Fax:	011 44 1509220020

FCCID	S6JSMT	
Product	Exxon Mobile Sled with Symbol PDA	
EUT Model Number	Exxon Mobile Sled with Symbol PDA	
EUT Serial Number	None	
Quantity Production Planned	Quantity production is planned.	
Modulation(s)	CDMA Cell and CDMA PCS	
Emission Designators	1M29F9W	
Frequency Tolerance	$\pm 0.00025\%$ (2.5ppm)	
Maximum Conducted RF Output Power (Measured)	24.1dBm (Cell Band); 24.5dBm (PCS Band)	
Frequency Range	824.7 – 848.31 MHz (Cell Band)	1851.25 – 1908.75 MHz (PCS Band)
Antenna & Gain	Galtronics Part Number: 20252076-3070	Gain: 2.71dBi (Cell); 2.95dBi (PCS)
Detachable Antenna	Yes	
Related Submittals / Grants	None	
EUT receive date:	3/21/2005	
EUT receive condition:	The EUT was received in good condition with no apparent damage.	
Test start date:	3/23/2005	
Test completion date:	3/30/2005	
FCC Rule Part(s)	FCC Part 22 Subpart H, Part 24 Subpart E, Part 15, Part 2	
Industry Canada Rule Part(s)	RSS-129, RSS-133, IC ES-003	
Modifications Required For Compliance	No modifications were implemented by the Intertek staff.	

The test results in this report pertain only to the item tested.

1.1.1 System Support Equipment

Table 1-1 contains the details of the support equipment associated with the Equipment Under Test during the FCC Part 15 testing.

Table 1-1: System Support Equipment

Description	Manufacturer	Model Number	Serial Number
AC Adapter	Technology Solutions	EPA-201D-09	Not Labeled
Pocket PC	Symbol	PPT8860-R3BZ1000	SA0118K07H

1.1.2 Cables associated with EUT

Table 1-2 contains the details of the cables associated with the EUT.

Table 1-2: Interconnecting cables between modules of EUT

3 TEST FACILITY

The INTERTEK-Lexington is located at 731 Enterprise Drive, Lexington Kentucky, 40510. The radiated emission test site is a 10-meter semi-anechoic chamber. The chamber meets the characteristics of CISPR 16-1: 1993 and ANSI C63.4: 1992. For measurements, a remotely controlled flush-mount metal-top turntable is used to rotate the EUT a full 360 degrees. A remote controlled non-conductive antenna mast is used to scan the antenna height from one to four meters. The Industry Canada filing number for this site is 2055.

4 CONDUCTED RF POWER

FCC Rule: §2.1046

IC Rule: RSS-129 §7.1, §9.1 and RSS-133 §6.2

4.1 Test Procedure

The transmitter output was connected to a calibrated coaxial cable, the other end of which was connected to a CMU-200 Base Station Simulator. The Base Station Simulator was set to force the EUT to its maximum power setting. The EUT was placed into a call and the transmitter output was read off the CMU-200 in dBm. The power output at the transmitter antenna port was determined by adding the value of the cable insertion loss to the CMU-200 power reading.

Tests were performed at three frequencies (low, middle, and high channels) and on the highest power levels, which can be setup on the transmitters.

4.2 Test Results

The Exxon Mobile Sled with Symbol PDA met the RF power output requirements of FCC Part 22 Subpart H and FCC Part FCC Part 24 Subpart E. The test results are located in Table 4-1.

Table 4-1 RF Power Variation with temperature

Power Variation Vs. Temperature (dBm)						
Temp. (Celcius)	CDMA Cell			CDMA PCS		
	1013	384	777	25	600	1175
60	23.2	23.3	24.1	24.5	24.5	24.4
20	23.4	23.3	23.6	24.0	24.1	24.1
-30	23.4	23.2	23.4	23.93	23.97	23.9

5 RADIATED RF POWER

FCC Rule §22.913

FCC Rule §24.232; RSS-133 §6.2

RSS-129 §7.1, §9.1

5.1 Test Limits

For the CDMA Cell band the Effective Radiated Power (ERP) of mobile transmitters was not allowed to exceed 7 Watts. For the CDMA PCS band the Equivalent Isotropic Radiated Power (EIRP) was not allowed to exceed 2 Watts.

5.2 Test Procedure

The EUT was placed on a non-conductive turntable. The Base Station Simulator was set to force the EUT to its maximum power setting. The radiated emission at the fundamental frequency was measured at 3m with a test antenna and EMI receiver. This was performed with the antenna in both vertical and horizontal polarities.

During the measurement of the EUT, the receiver resolution bandwidth was set to 3 MHz and the video bandwidth was set to 3 MHz. The highest emission was recorded with the rotation of the turntable and the raising and lowering of the test antenna. The receiver reading was recorded (E in dBm).

ERP in the Cell band and EIRP in the PCS band were measured using a substitution method as described in TIA-603-B Section 2.2.17 (Radiated Power Output). The EUT was replaced with a substitution antenna (tuned dipole below 1 GHz; Horn antenna above 1 GHz) and was fed with an input power of 15 dBm. The receiver reading was recorded and EIRP was calculated as follows:

$$\text{EIRP} = E_1 - E_2 + V_{\text{sub}} + G$$

where,

E₁ is the receiver reading in dBμV/m when measuring the field strength of the EUT

E₂ is the receiver reading in dBμV/m when measured field strength from the generator

V_{sub} is the power delivered to the substitution antenna (generator output in dBm – cable loss between the generator and the substitution antenna)

G is the gain of the transmitting antenna in dBi.

5.3 Test Results

The Exxon Mobile Sled with Symbol PDA met the radiated power requirements of FCC §24.232. The test results are located in Table 5-1. The maximum ERP for the Cell band was 25.42dBm. The maximum EIRP for the PCS band was 27.04dBm.

Table 5-1 Radiated RF Power

EUT Mode	TX Channel	Polarity	Measured Frequency (MHz)	Device Reading (dBuV)	Sub. Reading (dBuV)	Cable Loss (dB)	Tx Antenna Gain (dBi)	Signal Generator Output (dBm)	EIRP (dBm)

CDMA PCS	1175	V	1908.75	86.09	83.38	3.4	8.2	15	22.51
CDMA PCS	25	H	1851.25	91.78	84.54	3.4	8.2	15	27.04
CDMA PCS	600	H	1880	90.85	83.71	3.4	8.2	15	23.66
CDMA PCS	1175	H	1908.75	87.12	83.01	3.4	8.2	15	23.91

6 MAXIMUM PERMISSIBLE EXPOSURE (MPE) CALCULATIONS

6.1 Test Limits

The Radiofrequency radiation exposure limits for FCC Rule § 1.1310 are listed in the table below.

	Frequency Range (MHz)	Power Density Limit (mW/cm ²)
Limits for Occupational/Controlled Exposures	0.3-3.0	100
	3.0-30	900/ Frequency ²
	30-300	1.0
	300-1500	Frequency/300
	1500-100,000	5.0
Limits for General Population/Uncontrolled Exposure	0.3-1.34	100
	1.34-30	180/Frequency ²
	30-300	0.2
	300-1500	Frequency/1500
	1500-100,000	1.0

6.2 Test Procedure

The ERP and EIRP were measured in section 5. The radiated RF power was used to calculate the maximum RF exposure at a 20 cm distance using the formula:

$$\text{Maximum RF Exposure at 20cm} = (\text{EIRP in mW}) / (4\pi(20\text{cm})^2)$$

Where ERP was measured in section 5, a 2.15dB conversion factor was added to the reading to convert it to EIRP before applying the Maximum RF Exposure formula above. Once the Maximum RF Exposure calculations were complete the results were compared to the MPE limits above.

6.3 Test Results

The following calculations show the Maximum RF Exposure from the Exxon Mobile Sled with Symbol PDA at 20cm for CDMA Cell and PCS bands. Both bands are well below the limits for the general population described in the table above.

$$\text{MPE}_{\text{Cell}} = 348.3\text{mW} / (4\pi(20\text{cm})^2) = .069 \text{ mW/cm}^2$$

$$\text{MPE}_{\text{PCS}} = 505.8\text{mW} / (4\pi(20\text{cm})^2) = 0.10 \text{ mW/cm}^2$$

7 EMISSION LIMITATIONS, OCCUPIED BANDWIDTH

CFR 47 §2.1049

RSS-129 §6.3; RSS-129 §8.1

7.1 Test Limits

The occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission.

7.2 Test Procedure

In both CDMA Cell and PCS modes the antenna port of the EUT was connected to a spectrum analyzer using a calibrated coaxial cable and power divider. The EUT was placed into a call using a CMU – 200 base station simulator. The Base Station Simulator was set to force the EUT to its maximum power setting. The occupied bandwidth function of the analyzer was used to automatically generate the occupied bandwidth plots below.

7.3 Test Results

The following is the occupied bandwidth data for the Exxon Mobile Sled with Symbol PDA .

Table 7-1: Occupied bandwidth measurements

Mode	Channel	Resolution Bandwidth	Video Bandwidth	Sweep time	Measured Bandwidth MHz
CDMA Cell	1013	30kHz	1MHz	5s	1.28
CDMA Cell	384	30kHz	1MHz	5s	1.29
CDMA Cell	777	30kHz	1MHz	5s	1.29
CDMA PCS	25	30kHz	1MHz	5s	1.29
CDMA PCS	600	30kHz	1MHz	5s	1.29
CDMA PCS	1175	30kHz	1MHz	5s	1.29

Figure 7-1: Occupied Bandwidth – CDMA Cell Channel 1013

Figure 7-3: Occupied Bandwidth – CDMA Cell Channel 384

Figure 7-5: Occupied Bandwidth – CDMA Cell Channel 777

Figure 7-7: Occupied Bandwidth – CDMA PCS Channel 25

Figure 7-9: Occupied Bandwidth – CDMA PCS Channel 600

Figure 7-11: Occupied Bandwidth – CDMA PCS Channel 1175

8 OUT OF BAND EMISSION AT ANTENNA TERMINALS

FCC §2.1049, FCC §2.1051, §22.917(a), FCC §24.238(a)

RSS-129 §6.3, §7.2.2, §8.1.1, §10

RSS-133 §6.3

8.1 Test Limits

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB. Therefore, the test limit is defined by the following formula:

$$\text{Test Limit (dBm)} = \text{Tx Power (dBm)} - (43 + 10 \log (\text{Tx Power (Watts)})) = -13\text{dBm}$$

8.2 Test Procedure

Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kHz or greater for the Cellular band and 1 MHz or greater in the PCS band. In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (*i.e.* 100 kHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

The RF output of the transceiver was connected to a spectrum analyzer through appropriate attenuation. The Base Station Simulator was set to force the EUT to its maximum power setting. The resolution bandwidth of the spectrum analyzer was set at 1 MHz. Sufficient scans were taken to show the out of band Emissions if any up to 10th harmonic.

8.3 Test Results

The Exxon Mobile Sled with Symbol PDA met the out of band emission at antenna terminal requirements.

Table 8-1: Summary of test result locations

Location	Mode (Band)	Channel	Description

9 FIELD STRENGTH OF SPURIOUS RADIATION

FCC §2.1053; FCC §22.917; FCC §24.238

RSS-129 §8.1

9.1 Test Limits

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB. Therefore, the test limit is defined by the following formula:

$$\text{Test Limit (dBm)} = \text{Tx Power (dBm)} - (43 + 10 \log(\text{Tx Power (Watts)})) = -13\text{dBm}$$

9.2 Test Procedure

The EUT was placed on a non-conductive turntable. The measurement antenna was placed at a distance of 3 meters from the EUT. The Base Station Simulator was set to force the EUT to its maximum power setting. During the tests, the antenna height and EUT azimuth were varied in order to identify the maximum level of emissions from the EUT.

The frequency range up to tenth harmonic was investigated for each of three fundamental frequencies (low, middle, and high channels) in each operating band. Once spurious emissions were identified, the power of the emission was determined using the substitution method described in TIA-603-B section 2.2.12 (Radiated Spurious Emissions).

The spurious emissions attenuation was calculated as the difference between radiated power at the fundamental frequency and at the spurious emissions frequency.

9.3 Test Results

The Exxon Mobile Sled with Symbol PDA met the field strength of spurious radiation requirements of FCC §2.1053, FCC §22.917, and FCC §24.238. See Table 9-1 for measured radiated spurious emission power for emissions within 20 dB of the limit. All other emissions not reported are at least 20dB below the limit.

Table 9-1: Field Strength of Spurious Radiation Substitution Measurements

EUT Mode	TX Channel	Polarity	Measured Frequency (GHz)	Device Reading (dBuV)	Sub. Reading (dBuV)	Cable Loss (dB)	Tx Antenna Gain (dBi)	Signal Generator Output (dBm)	EIRP (dBm)

10 POWER LINE CONDUCTED EMISSIONS

FCC §15.107, FCC §15.207

IC ES-003

10.1 Test Limits

Table 10-1 lists the conducted emission limits for both class A and B devices.

Table 10-1 Conducted Emission Limit for FCC §15.207(a)

Frequency Range (MHz)	Class A Limits		Class B Limits	
	FCC Part 15.107(a) Quasi Peak Limit (dBuV)	FCC Part 15.107(a) Average Limit (dBuV)	FCC Part 15.107(a) Quasi Peak Limit (dBuV)	FCC Part 15.107(a) Average Limit (dBuV)
0.15 – 0.5	79	66	66 to 56	56 to 46
0.5 – 5.0	73	60	56	46
5.0 - 30	73	60	60	50

10.2 Test Procedure

Measurements are carried out using quasi-peak and average detector receivers in accordance with CISPR 16. An AMN is required to provide a defined impedance at high frequencies across the power feed at the point of measurement of terminal voltage and also to provide isolation of the circuit under test from the ambient noise on the power lines. An AMN as defined in CISPR 16 shall be used.

The EUT is located so that the distance between the boundary of the EUT and the closest surface of the AMN is 0.8m.

Where a flexible mains cord is provided by the manufacturer, this shall be 1m long or if in excess of 1m, the excess cable is folded back and forth as far as possible so as to form a bundle not exceeding 0.4m in length.

The EUT is arranged and connected with cables terminated in accordance with the product specification.

Conducted disturbance is measured between the phase lead and the reference ground, and between the neutral lead and the reference ground. Both measured values are reported.

The EUT, where intended for tabletop use, is placed on a table whose top is 0.8m above the ground plane. A vertical, metal reference plane is placed 0.4m from the EUT. The vertical metal reference-plane is at least 2m by 2m. The EUT shall be kept at least 0.8m from any other metal surface or other ground plane not being part of the EUT. The table is constructed of non-conductive materials. Its dimensions are 1m by 1.5m, but may be extended for larger EUT.

Floor standing EUTs are placed on a horizontal metal ground plane and isolated from the ground plane by 3 to 12 mm of insulating material. The metal ground plane extends at least 0.5m beyond the boundaries of the EUT and has minimum dimensions of 2m by 2m.

Equipment setup for conducted disturbance tests followed the guidelines of ANSI C63.4: 1992.

10.3 Test Results

The Exxon Mobile Sled with Symbol PDA met the power line conducted emission requirements of FCC §15.107 and §15.207. The test results are located in Figure 10-1. The graphical data, measured with peak detection, was all below the class A quasi-peak and average limits.

Figure 10-1: FCC §15.107 and §15.207 power line conducted emissions (Lines 1 and 2)

11 RECEIVER SPURIOUS EMISSIONS

FCC §15.109

IC ES-003, RSS-129 §10, RSS-133 §9

11.1 Test Limits

Table 11-1 lists the Class A and B limits for spurious using quasi-peak detection below 1GHz and average detection above 1GHz.

Table 11-1 Radiated Emission Limit for FCC §15.109

Frequency (MHz)	3 Meter Limits		10 Meter Limits	
	Class A	Class B	Class A	Class B
	Quasi-Peak limits dB(μV/m)	Quasi-Peak limits, dB(μV/m)	Quasi-Peak limits dB(μV/m)	Quasi-Peak limits, dB(μV/m)
30 to 88	49.6	40	39.1	29.5
88 to 216	54.0	43.5	43.5	33.1
216 to 960	56.9	46.0	46.4	35.6
960 and up	60.0	54.0	49.5	43.5

11.2 Test Procedure

Measurements are made over the frequency range of 30 MHz to five times the highest frequency operating within the device. The measuring receiver meets the requirements of Section One of CISPR 16 and the measuring antenna correlates to a balanced dipole. From 30 to 1000 MHz, a quasi-peak detector was used for measurement. Above 1000 MHz, average measurements were performed.

Measurements of the radiated field are made with the antenna located at a distance of 3 meters from the EUT. If the field-strength measurements at 3m cannot be made because of high ambient noise level or for other reasons, measurements may be made at a closer distance, for example 1m. An inverse proportionality factor of 20 dB per decade should be used to normalize the measured data to the specified distance for determining compliance.

The antenna is adjusted between 1m and 4m in height above the ground plane for maximum meter reading at each test frequency.

The antenna-to-EUT azimuth is varied during the measurement to find the maximum field-strength readings.

The antenna-to-EUT polarization (horizontal and vertical) is varied during the measurements to find the maximum field-strength readings.

The EUT, where intended for tabletop use, is placed on a table whose top is 0.8m above the ground plane. The table is constructed of non-conductive materials. Its dimensions are 1m by 1.5m, but may be extended for larger EUT.

Equipment setup for radiated disturbance tests followed the guidelines of ANSI C63.4: 1992.

11.3 Test Results

The Exxon Mobile Sled with Symbol PDA was **compliant** with the radiated disturbance requirements of FCC §15.109 for a **class A** device. The maximized quasi peak data can be found in Figure 11-3.

12 FREQUENCY STABILITY VS TEMPERATURE

FCC §2.1055, FCC §22.355, FCC §24.235

RSS-133 §7

12.1 Test Limits

The frequency tolerance shall be maintained within: $\pm 2.5\text{ppm}$ (or 0.00025MHz)

12.2 Test Procedure

The equipment under test was powered and the RF output was connected to a CMU-200 Base Station Simulator. The Base Station Simulator was set to force the EUT to its maximum power setting. The EUT was placed inside the temperature chamber. The RF output cable exited the chamber through an opening made for that purpose. After the temperature stabilized for approximately 30 minutes, the frequency error was read from the CMU-200.

12.3 Test Results

The Exxon Mobile Sled with Symbol PDA met the frequency stability requirements of FCC §2.1055, FCC §22.355 and FCC §24.235. The test results are located in Table 12-1.

Table 12-1: Frequency stability vs. Temperature

Frequency Stability Vs. Temperature (Hz)						
Temp. (Celsius)	CDMA Cell			CDMA PCS		
	1013	384	777	25	600	1175
60	-5	-3	1	-17	-20	-16
50	-7	-7	-9	-15	-16	-13
40	3	-8	-3	-10	-18	0
30	-4	6	-7	-6	-2	-4
20	0	0	-1	-17	-15	-11
10	6	4	-1	-9	-13	5
0	8	5	3	-13	6	-2
-10	-4	-1	5	3	8	7
-20	6	7	12	7	10	3
-30	5	1	-3	4	4	1

13 FREQUENCY STABILITY VS VOLTAGE

FCC §2.1055, FCC §22.355, FCC §24.235

13.1 Test Limits

The frequency tolerance shall be maintained within: $\pm 2.5\text{ppm}$ (or 0.00025MHz)

13.2 Test Procedure

The battery was replaced with a variable output DC power supply. The Base Station Simulator was set to force the EUT to its maximum power setting. The voltage was set to 115% of the nominal value and was then decreased to 85% of the nominal value. The output frequency was recorded for each input voltage.

13.3 Test Results

The Exxon Mobile Sled with Symbol PDA met the frequency stability requirements of FCC §2.1055, FCC §22.355, and §24.235. The test results are located in Table 13-1.

Table 13-1: Frequency stability vs. input voltage

Frequency Stability Vs. Voltage						
Voltage (V)	CDMA Cell			CDMA PCS		
	1013	384	777	25	600	1175
4.25	-5	-3	6	-8	-4	2
3.7	-3	0	-2	-6	2	-7
3.145	-6	-4	3	5	7	-6
