Section 1. Summary of Test Results

Manufacturer: Andrew Corporation
Product Name: RRH 2x45W 1900MHz AA190045
Part No.: RF151032-1C

General: **All measurements are traceable to national standards**

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 24, Subpart E.

☐ New Submission ☒ Production Unit
☒ Class II Permissive Change ☐ Pre-Production Unit

THIS TEST REPORT RELATES ONLY TO THE ITEM(S) TESTED.

ORIGINAL GRANT: FCC ID: S8L-AA190045 dated on 07/18/2013

THE FOLLOWING DEVIATIONS FROM, ADDITIONS TO, OR EXCLUSIONS FROM THE TEST SPECIFICATIONS HAVE BEEN MADE.

See "Summary of Test Data"

EUT Change(s): No hardware changes. Additional 15MHz bandwidth carrier, with same output power/modulation, was added via software settings.

NVLAP LAB CODE: 200101-0

DC voltages and DC currents per 2.1033(c)(8)

The input supply to the Remote Radio Head (RRH) was set at -48 Volts DC. The RF power output was measured with the indicated voltage and current applied into the RRH.

RRH 2x45W 1900MHz AA190045

RF Output, DC Current and RF Input Power are all average values.

Active Mode:

Measured Rated RF output @ each Tx port: 46.5dBm (45W)

Measured DC voltage: -48.0V

Measured DC current: 8.02A.

Standby Mode:

Measured Minimum RF output: -16.4dBm (0.023mW)

Measured DC voltage: -48.0V

Measured DC current: 1.03A

Tune-up procedure per 2.1033(c) (9)

There are no user accessible adjustments or tuning in this EUT. All necessary adjustments and tuning are performed during manufacture of the product. Any adjustments or tuning after service or repair are done as part of that process as special equipment is required to perform such adjustments.

Description of Operation

The EUT operated in FCC 1900MHz band, has two identical sections, each has one RF transmitter & two receivers, a double duplex filter and a dual simplex filter.

All measurements shall be made at room temperature and at nominal DC input voltage unless noted otherwise. All measurements were performed with the EUT configured for maximum transmit power.

System Diagram

See Attachment.

General EUT Setup

TX Waveforms & Operation Frequency Channels for testing:

Waveforms: TM11 (QPSK), TM32 (16QAM) and TM31 (64QAM) *

Carrier Configurations	Frequency	Carrier BW	IBW	Carrier 1 Center Frequency	Carrier 2 Center Frequency	Confirmed
1C	Low	15MHz	15MHz	1937.5MHz	N/A	Y
1C	Middle	15MHz	15MHz	1962.5MHz	N/A	Y
1C	High	15MHz	15MHz	1987.5MHz	N/A	Y
2C	Low	15 & 5 MHz	40MHz	1937.5MHz	1957.5MHz	Y
2C	Middle	15 & 5 MHz	40MHz	1952.5MHz	1972.5MHz	Y
2C	High	15 & 5 MHz	40MHz	1972.5MHz	1992.5MHz	Y
2C	Low	5 & 15 MHz	40MHz	1932.5MHz	1937.5MHz	Y for lower band edge test
2C	High	5 & 15 MHz	40MHz	1987.5MHz	1992.5MHz	Y for higher band edge test

* Same waveforms in original application were used in this application. Based on previous/pre-scan testing results, there is no significant measurement difference between TM32 and TM3. Therefore TM11 & TM31 were chosen for final testing data collection.

Section 3. RF Output Power

Name of Test:	<i>RF Output Power</i>	Test Standard:	24.232(a)
Tested By:	WEI LI	Test Date:	06/17/2013-06/25/2013

Minimum Standard: Para. No. 24.232(a). The maximum peak output power of base transmitters should not exceed 1640W/MHz EIRP (62.1dBm/MHz).

Para No. 24.232(d). In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13 dB.

Method of Measurement: The manufacturer will provide an external antenna with maximum gain 17.5dBi for this product; hence system EIRP can be calculated per FCC KDB 971168 D01 Power Measurement License Digital Systems V02r2, i.e.

$EIRP \text{ (dBm/MHz)} = RF \text{ Output Power at antenna port} + 17.5$

For devices utilizing multiple antennas, KDB 662911 provides guidance for determining the effective array transmit antenna gain term to be used in the above equation.

Per 2.1046: The RF Power Output level measured at each antenna port shall be +46.5 dBm (45 watts) +1 dB, -3 dB over the PCS frequency band: 1930-1995 MHz. The tolerance range is per TIA/EIA-97-D, Section 4.3.1.3.

Using power meter, average power measurements shall be taken at the low band edge, mid, and high band edge frequencies for all modulations listed on Page 7.

Per FCC KDB 971168 Sec. 5.7, Peak-to-Average Power Ratio (PAR) shall be measured to meet the <13dB limit.

Test Result:

Complies

Test Data:

Following tables

Rated Output Power – Normal Condition

The inputs are set to generate rated average output power and crest factor for the multi-carrier signals intended.

15M LTE 1C	46.42	46.43	46.44
15 & 5M LTE 2C	46.31	46.29	46.27

EIRP POWER CALCULATIONS:

Max EIRP at TX output port for 15MHz LTE case,
To calculate the spectral power in 1MHz, the following conversion must be made:
 $10 * \text{LOG} (15\text{MHz} / 1\text{MHz}) = 11.7 \text{ dB}$
Therefore, $46.47 - 11.7 = 34.77\text{dBm/MHz}$.
Antenna's gain is 17.5dBi,
 $\text{EIRP} = 34.77 + 17.5 = 52.27 \text{ dBm/MHz}$
FCC limit is $1640\text{W/MHz} = 62.1\text{dBm/MHz}$

Conclusion:

The two individual TX ports delivered the similar output RF power levels, 46.47dBm (44.36W) and 46.45dBm (44.16W). Each meets FCC power limit requirement based on the above calculation result.

Total combined Power=44.36W+44.16W=88.52W, ie. 49.47 dBm.
EIRP(total)=(49.47-11.7)+17.5=55.27dBm, which is still under FCC limit (62.1dBm).

Considering the identical design between TX1 and TX2 RF paths, one of TX ports was chosen for completed testing suite. Selected tests were also performed on 2nd Tx port.

Section 4. Occupied Bandwidth

Name of Test:	<i>Occupied Bandwidth</i>	Test Standard:	<i>2.1049(i)</i>
Tested By:	WEI LI	Test Date:	10/30/2014-11/04/2014

Minimum Standard: Not defined by FCC. Input vs. Output.

Method of Measurement: Spectrum Analyzer Settings:
RBW: 200kHz
VBW: ≥ 3 RBW
Span: As required
Sweep: Auto
Detector: Sampling
Input Signal Characteristics: Generated from Digital Input
RF level: Rated, recommended by manufacturer

Test Result:**Complies****Test Data:**

Section 5. Spurious Emissions at Antenna Terminals

Name of Test:	<i>Spurious Emissions at Antenna Terminals</i>	Test Standard:	24.238(a)
Tested By:	WEI LI	Test Date:	06/17/2013-06/25/2013

Minimum

Standard: Para. No. 24.238(a). The magnitude of each spurious and harmonic emission that can be detected when the equipment is operated under conditions specified in the instruction manual and/or alignment procedure, shall not less than $43+10 \log$ (mean output power in watts) dBc below the mean power output outside a licensee's frequency block (-13dBm).

Method of Measurement: Spectrum Analyzer Settings:
RBW: 1MHz (100 kHz RBW for band edge measurement)
VBW: $\geq$ RBW
Start Frequency: 9KHz or Lowest Clock Frequency
Stop Frequency: 20GHz (PCS)
Sweep: Auto or greater.
Using in-band filter if needed.
For Inter-modulation measurement: 2 carriers RF signals set as inputs per Frequency Table on page 7. The frequencies of RF signals shall be within the unit's operating band The level of both RF input signals shall be increased, until the maximum rated output power per channel, as declared by the manufacturer, is reached.

Section 6. Field Strength of Spurious

Name of Test:	<i>Field Strength of Spurious</i>	Test Standard:	<i>22.917</i> <i>24.238</i>
Tested By:	WEI LI	Test Date:	06/17/2013-06/25/2013

Minimum

Standard: Para. No. 24.238(a). The magnitude of each spurious and harmonic emission that can be detected when the equipment is operated under conditions specified in the instruction manual and/or alignment procedure, shall not less than $43 + 10 \log$ (mean output power in watts) dBc below the mean power output outside a licensee's frequency block (-13dBm).

Method of Measurement: TIA/EIA-603, Section 2.2.12
The antenna substitution method was used to determine the equivalent radiated power at spurious frequencies. The spurious emissions were measured at a distance of 3 meters. The EUT was then replaced with a reference substitution antenna with a known gain referenced to a dipole. This antenna was fed with a signal at the spurious frequency. The level of the signal was adjusted to repeat the previously measured level. The resulting ERP is the signal level fed to the reference antenna corrected for gain referenced to a dipole.

Per FCC KDB 971168 v02r2, Measurement Guidance for Certification of Licensed Digital Transmitters, the approach using Mathematical Conversions in Sec. 5.8.3 can be used in this case.

*Base on pre-testing results for different operation modes shown on page 7, the data for the worst case, 15MHz BW/QPSK/1 Carrier, configuration, was recorded as final result.

Test Result:

Section 7. Frequency Stability

Name of Test:	<i>Frequency Stability</i>	Test Standard:	<i>2.1055 22.355&24.235</i>
Tested By:	WEI LI	Test Date:	06/17/2013-06/25/2013

Minimum Standard: Para No. 24.235. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

Method of Measurement: Frequency Stability With Voltage Variation:
The E.U.T. is placed in an environmental chamber and allowed to stabilize at +25 degrees Celsius for at least 15 minutes. Set SA resolution bandwidth low enough (30Hz) to obtain the desired frequency resolution. (Using frequency counter method: The frequency counter and signal generator are phase locked with the same 10 MHz reference frequency by connecting the 10 MHz ref. out of the counter to the 10MHz ref, in of the signal generator). With the voltage input to the E.U.T. set to 85% S.T.V., the frequency is measured in 30 second intervals for a period of 5 minutes. This procedure is repeated at 100% S.T.V. and 115% S.T.V.

Frequency Stability With Temperature Variation:
The input voltage to the E.U.T. is set to S.T.V. and the temperature of the environmental chamber is varied in 10 degree steps from -40 degrees C to +60 degrees C. The E.U.T. is allowed to stabilize at each temperature and the frequency is measured in 30 second intervals for a period of 5 minutes.

Test Result:**Complies****Test Data:**

See Attached Table

Frequency Stability Data in original application**Transmit Frequency Versus:
Temperature, DC Supply Voltage, and Carrier Bandwidths**

DC Supply Voltage (V)	Temp (C)	Freq Error @ TX1 (Hz)			Freq Error @ TX2 (Hz)
