SUMMARY OF TESTING

Test Specification	Description of Test	Result
§15.209 / RSS-GEN 8.9	Unintentional Radiated Emissions	PASS

EUT Test Conditions during Testing

The EUT was configured into the wanted channel and was in continuous transmit mode during all the tests. The power of all data rates and channels low, mid and high were measured with a power meter and the data rate giving the highest power was selected for the measurements. Highest power was measured with data rate DH5 (2.355 dBm). The radiated spurious emissions tests were performed with the EUT being in three different orthogonal positions: X, Y, Z.

Following channels were used during the tests:

Channel	Frequency/ MHz
LOW	2402
MID	2440
HIGH	2480

Transmitter Radiated Emissions 30 – 26 500 MHz and Band Edge

Standard: ANSI C63.10 (2009)
Tested by: NKO/PKA
Date: 16.02. – 23.02.2015
Temperature: 21 – 23 °C
Humidity: 29 – 39 % RH
Measurement uncertainty: ± 4.51 dB Level of confidence 95 % (k = 2)

FCC Rule: 15.247(d), 15.209(a)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a).

The correction factor in the final result table contains the sum of the transducers (antenna + amplifier + cables). The QuasiPeak value is the measured value corrected with the correction factor.

Measurements were done with DH5 1 Mbps data rate.
