VERIFICATION OF COMPLIANCE

Applicant:	MICROLAB TECHNOLOGY COMPANY LIMITED Huachang Industrial Area, Dalang, Longhua Country, Baoan District, Shenzhen, China
Product Description:	Interphone
Brand Name:	N/A
Model Number:	T-97SE
Serial Number:	N/A
File Number:	SZE0503046
Date of Test:	March 25,2005 ~ April 24, 2005

We hereby certify that:

The above equipment was tested by COMPLIANCE CERTIFICATION SERVICES (SHENZHEN) INC. The test data, data evaluation, test procedures, and equipment configurations shown in this report were made in accordance with the procedures given in ANSI C 63.4:2001 and the sample tested as described in this report is in compliance with the FCC Rules Part 90.

The test results of this report relate only to the tested sample identified in this report.

---------------------------	----------------

1. GENERAL INFORMATION**1.1 Product Description**

The Microlab Technology company limited, Model: T-97SE (referred to as the EUT in this report). The EUT is a 16-channel Interphone designed for voice communication only. It is designed by way of utilizing the FM modulation achieves the system operating.

A major technical descriptions of EUT is described as following:

- A). Frequency Tolerance: 0.00018% (0.00025%)
- B). Communication Type: Voice/Tone only
- C). Modulation: FM
- D). Emission type: F3E
- E). Emission designator: 9KF3E (2M+2D, M=2, D=2.5, Necessary Bandwidth =9 KHz)
- F). Emission Bandwidth: 11 KHz (Limit: 12.5 KHz)
- G). Peak Frequency Deviation: 1.5 KHz at 0 dB reference (Limit < ± 2.5 KHz)
- H). Audio Frequency Response: 2 KHz (Limit < 3.125 KHz)
- G). Maximum Transmitter Power: 2.443W
- H). Output power Modification: Fixed can't be changed
- I). Unwanted Radiation:
 - 1). At least 10 (Limit 0 dB) On any frequency removed from the center of the authorized bandwidth f_0 to 5.625 KHz removed from f_0 : Zero dB
 - 2). At least 15 (Limit 7.27 dB) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in KHz) f_0 of more than 5.625 KHz but no more than 12.5 KHz: At least 7.27dB
 - 3). At least 80 (Limit 53.88 dB) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in KHz) f_0 of more than 12.5 KHz: At least $50+10 \log(P)$ dB or 70 dB, which ever is lesser attenuation.
- J). Antenna Designation: Detachable
- K). Power Supply: 7.2 V dc by battery
- L). DC Voltage= 6.0 V and DC Current= 180 mA into the final stage for normal operation over the power range
- M). Battery Endpoint: DC 6.0 V
- N). Operating Frequency Range and Channels
 Frequency Range: 450.125 ~ 469.987MHz
 Total 16 channels:

CH 01 ---- 450.125 MHz	CH 02 ---- 460.125 MHz
CH 03 ---- 469.987 MHz	CH 04 ---- 455.050 MHz
CH 05 ---- 459.900 MHz	CH 06 ---- 459.800 MHz
CH 07 ---- 459.700 MHz	CH 08 ---- 459.600 MHz
CH 09 ---- 459.500 MHz	CH 10 ---- 459.400 MHz
CH 11 ---- 459.300 MHz	CH 12 ---- 459.200 MHz
CH 13 ---- 459.100 MHz	CH 14 ---- 469.950 MHz
CH 15 ---- 459.987 MHz	CH 16 ---- 460.450 MHz
- O). Effective distance: Nominal 3 miles, with 2.443 W power output

1.2 Related Submittal(s) / Grant (s)

This submittal(s) (test report) is intended for FCC ID: SCUMICROLABT-004 filing to comply with the FCC Part 90 requirements

1.3 Test Methodology

The radiated emission testing was performed according to the procedures of ANSI C63.4 and FCC CFR 47 2.1046, 2.1047, 2.1049, 2.1051, 2.1053, 2.1055 and 2.1057

1.4 Test Facility

The open area test site used to collect the radiated data is located on the address of COMPLIANCE CERTIFICATION SERVICES (SHENZHEN) INC. No. 6, Jinao industrial park, No.35 Jukeng Road, Dashuikeng Village, Guanlan Town, Baoan District, Shenzhen, China. The Open Area Test Site is constructed and calibrated to meet the FCC requirements in documents ANSI C63.4: 2001 and CISPR 22/EN 55022 requirements.

1.5 Special Accessories

Not available for this EUT intended for grant.

1.6 Equipment Modifications

Not available for this EUT intended for grant.

2. System Test Configuration

2.1 EUT Configuration

The EUT configuration for testing is installed on RF field strength measurement to meet the Commission's requirement and operating in a manner which intends to maximize its emission characteristics in a continuous normal application.

2.2 EUT Exercise

The Transmitter was operated in the normal operating mode. the TX frequency was fixed which was for the purpose of the measurements.

2.3 GENERAL TECHNICAL REQUIREMENTS

- a). Section 90.205: Maximum ERP is dependent upon the station's antenna HAAT and required service area
- b). Section 90.207: Modulation Characteristic
- c). Section 90.209: Occupied Bandwidth
- d). Section 90.210: Emission Mask
- e). Section 90.213: Frequency Tolerance
- f). Section 90.214: Transmitter Frequency Behavior

2.4 Configuration of Tested System

Fig. 2-1 Configuration of Tested System

Table 2-1 Equipment Used in Tested System

Item	Equipment	Mfr/Brand	Model/Type No.	FCC ID	Series No.	Note
E-1	Interphone	N/A	T-97SE	SCUMICROLABT-004	N/A	<i>EUT</i>

3. SUMMARY OF TEST RESULTS

FCC Rules	Description Of Test	Result
§ 90.205	Maximum Transmitter Power	Compliant
§ 90.207	Modulation Characteristic	Compliant
§ 90.209	Occupied Bandwidth	Compliant
§ 90.210	Emission Mask	Compliant
§ 90.213	Frequency Tolerance	Compliant
§ 90.214	Transmitter Frequency Behavior	Compliant

4. DESCRIPTION OF TEST MODES

The EUT (Interphone) has been tested under normal operating condition. Three channels are chosen for testing.

5. FREQUENCY TOLERANCE

5.1 PROVISIONS APPLICABLE

- a). According to FCC Part 2 Section 2.1055(a)(1), the frequency stability shall be measured with variation of ambient temperature from -30°C to $+50^{\circ}\text{C}$ centigrade.
- b). According to FCC Part 2 Section 2.1055(d)(2), for hand carried battery powered equipment, the frequency stability shall be measured with reducing primary supply voltage to the battery operating end point, which is specified by the manufacture.
- c). According to FCC Part 90 Section 90.213, the frequency tolerance must be maintained within 0.00025%.

5.2 MEASUREMENT PROCEDURE

5.2.1 Frequency stability versus environmental temperature

1. Setup the configuration per figure 1 for frequencies measurement inside an environment chamber, Install new battery in the EUT.
2. Turn on EUT and set SA center frequency to the EUT radiated frequency. Set SA Resolution Bandwidth to 1KHz and Video Resolution Bandwidth to 1KHz and Frequency Span to 50KHz. Record this frequency as reference frequency.
3. Set the temperature of chamber to 50°C . Allow sufficient time (approximately 30 min) for the temperature of the chamber to stabilize. While maintaining a constant temperature inside the chamber, turn the EUT on and measure the EUT operating frequency.
4. Repeat step 2 with a 10°C decreased per stage until the lowest temperature -30°C is measured, record all measured frequencies on each temperature step.

5.2.2 Frequency stability versus input voltage

1. Setup the configuration per figure 1 for frequencies measured at temperature if it is within 15°C to 25°C . Otherwise, an environment chamber set for a temperature of 20°C shall be used. Install new battery in the EUT.
2. Set SA center frequency to the EUT radiated frequency. Set SA Resolution Bandwidth to 1KHz and Video Resolution Bandwidth to 1KHz. Record this frequency as reference frequency.
3. For battery operated only device, supply the EUT primary voltage at the operating end point which is specified by manufacturer and record the frequency.

6. EMISSION BANDWIDTH

6.1 PROVISIONS APPLICABLE

According to FCC Part 90 Section 90.209: The authorized bandwidth shall be 12.5 KHz.

6.2 MEASUREMENT PROCEDURE

- 1). The EUT was placed on a turn table which is 0.8m above ground plane.
- 2). Set EUT as normal operation
- 3). Set SPA Center Frequency = fundamental frequency , RBW=100 Hz, VBW= 1KHz, Span =100KHz.
- 4). Set SPA Max hold. Mark peak, -26dB.

7. UNWANTED RADIATION

7.1 PROVISIONS APPLICABLE

According to Section 90.210, the power of each unwanted emission shall be less than Transmitted Power as specified below for transmitters designed to operate with 12.5 KHz channel bandwidth:

- 1). On any frequency removed from the center of the authorized bandwidth f_0 to 5.625 KHz removed from f_0 : Zero dB
- 2). On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in KHz) f_0 of more than 5.625 KHz but no more than 12.5 KHz: At least 7.27dB
- 3). On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in KHz) f_0 of more than 12.5 KHz: At least $50+10 \log(P)$ dB or 70 dB, which ever is lesser attenuation.

7.2 MEASUREMENT PROCEDURE

- 1). On a test site, the EUT shall be placed on a turntable, and in the position closest to the normal use as declared by the user.
- 2). The test antenna shall be oriented initially for vertical polarization located 3m from the EUT to correspond to the transmitter.
- 3). The output of the antenna shall be connected to the measuring receiver and either a peak or quasi-peak detector was used for the measurement as indicated on the report. The detector selection is based on how close the emission level was approaching the limit.
- 4). The transmitter shall be switched on; if possible, without the modulation and the measurement receiver shall be tuned to the frequency of the transmitter under test.
- 5). The test antenna shall be raised and lowered through the specified range of height until the measuring receiver detects a maximum signal level.
- 6). The transmitter shall than be rotated through 360° in the horizontal plane, until the maximum signal level is detected by the measuring receiver.
- 7). The test antenna shall be raised and lowered again through the specified range of height until the measuring receiver detects a maximum signal level.
- 8). The maximum signal level detected by the measuring receiver shall be noted.
- 9). The measurement shall be repeated with the test antenna set to horizontal polarization.
- 10). Replace the antenna with a proper Antenna (substitution antenna).
- 11). The substitution antenna shall be oriented for vertical polarization and, if necessary, the length of the substitution antenna shall be adjusted to correspond to the frequency of transmitting.

12). The substitution antenna shall be connected to a calibrated signal generator.

13). If necessary, the input attenuator setting of the measuring receiver shall be adjusted in order to increase the sensitivity of the measuring receiver.

14). The test antenna shall be raised and lowered through the specified range of the height to ensure that the maximum signal is received.

15). The input signal to substitution antenna shall be adjusted to the level that produces a level detected by the measuring receiver, that is equal to the level noted while the transmitter radiated power was measured, corrected for the change of input attenuation setting of the measuring receiver.

16). The input level to the substitution antenna shall be recorded as power level in dBm, corrected for any change of input attenuator setting of the measuring receiver.

17). The measurement shall be repeated with the test antenna and the substitution antenna oriented for horizontal polarization.

8. MODULATION CHARACTERISTICS

8.1 PROVISIONS APPLICABLE

According to CFR 47 section 2.1047(a), for Voice Modulation Communication Equipment, the frequency response of the audio modulation circuit over a range of 100 to 5000Hz shall be measured.

8.2 MEASUREMENT METHOD

8.2.1 Modulation Limit

1). Configure the EUT as shown in figure 1, adjust the audio input for 60% of rated system deviation at 1KHz using this level as a reference (0dB) and vary the input level from -20 to +20dB. Record the frequency deviation obtained as a function of the input level.

2). Repeat step 1 with input frequency changing to 300,1004, and 2500Hz in sequence.

8.2.2 Audio Frequency Response

1). Configure the EUT as shown in figure 1.

2). Adjust the audio input for 20% of rated system deviation at 1 KHz using this level as a reference (0 dB).

3). Vary the Audio frequency from 100 Hz to 10 KHz and record the frequency deviation.

4). Audio Frequency Response = $20\log_{10}$ (Deviation of test frequency/Deviation of 1KHz reference).

Figure 1: Modulation characteristic measurement configuration

9. MAXIMUM TRANSMITTER POWER

9.1 PROVISIONS APPLICABLE

According to FCC Part 90 Section 90.205, the maximum ERP is dependent upon the station's antenna HAAT and required service area

9.2 MEASUREMENT PROCEDURE

Notes: The instrument setting used during the measurement procedure is as follow.

HP 8546A:	RW=120KHz, VBW=300KHz, C.F.=fundamental frequency, SPAN 5MHz, A trace MAX HOLD, B trace CLEAR WRIT
ADVANTEST:	RW=100KHz, VBW=100KHz, C.F.=Maximum peak Frequency, SPAN 0,TG ON

- 1). On a test site, the EUT shall be placed on a turntable, and in the position closest to the normal use as declared by the user.
- 2). The test antenna shall be oriented initially for vertical polarization located 3m from the EUT to correspond to the transmitter.
- 3). The output of the antenna shall be connected to the measuring receiver and either a peak or quasi-peak detector was used for the measurement as indicated on the report. The detector selection is based on how close the emission level was approaching the limit.
- 4). The transmitter shall be switched on; if possible, without the modulation and the measurement receiver shall be tuned to the frequency of the transmitter under test.
- 5). The test antenna shall be raised and lowered through the specified range of height until the measuring receiver detects a maximum signal level.
- 6). The transmitter shall than be rotated through 360 ° in the horizontal plane, until the maximum signal level is detected by the measuring receiver.
- 7). The test antenna shall be raised and lowered again through the specified range of height until the measuring receiver detects a maximum signal level.
- 8). The maximum signal level detected by the measuring receiver shall be noted.
- 9). Replace the antenna with a proper Antenna (substitution antenna).
- 10). The substitution antenna shall be oriented for vertical polarization and, if necessary, the length of the substitution antenna shall be adjusted to correspond to the frequency of transmitting.
- 11). The substitution antenna shall be connected to a calibrated signal generator.

12). If necessary, the input attenuator setting of the measuring receiver shall be adjusted in order to increase the sensitivity of the measuring receiver.

13). The test antenna shall be raised and lowered through the specified range of the height to ensure that the maximum signal is received.

14). The input signal to substitution antenna shall be adjusted to the level that produces a level detected by the measuring receiver, that is equal to the level noted while the transmitter radiated power was measured, corrected for the change of input attenuation setting of the measuring receiver.

15). The input level to the substitution antenna shall be recorded as power level in dBm, corrected for any change of input attenuator setting of the measuring receiver.

16). The measurement shall be repeated with the test antenna and the substitution antenna oriented for horizontal polarization.

17). The measure of the effective radiated power is the larger of the two levels recorded, at the input to the substitution antenna, corrected for the gain of the substitution antenna if necessary.

9.5 TEST RESULT

The Output Power of Interphone

Freq (MHz)	Antenna Polarity	Reading (dBuV)	SGOP (dBuV)	Ant. Gain (dB)	Correction Factor (dB)	Cable (dB)	Corrected Power	
							(dBm)	(mW)
450.125	V	116.08	133.52	5.3	-	1.8	30.02	1004.62
450.125	H	115.32	131.65	5.3	-	1.8	28.15	653.13
460.125	V	115.86	133.48	5.3	-	1.8	29.98	995.41
460.125	H	114.92	131.43	5.3	-	1.8	27.93	620.87
469.987	V	115.65	133.37	5.3	-	1.8	29.87	970.51
469.987	H	114.71	131.39	5.3	-	1.8	27.89	615.18

10 CONDUCTED OUTPUT POWER**10.1 Provisions Applicable**

Per FCC § 2.1046 and § 90.205: Maximum ERP is dependent upon the station's antenna HAAT and required service area.

10.2 Test Procedure

The RF output of transceiver was conducted to a spectrum analyzer through an appropriate attenuator.

10.3 Test Instruments

Open Area Test Site					
EQUIPMENT TYPE	MFR	MODEL NO.	SERIAL NO.	LAST CAL.	CAL DUE.
Spectrum Analyzer	ADVANTEST	R3132	N/A	06/29/2004	06/28/2005
Attenuator	R&S	50FH-010-30	N/A	12/18/2004	12/17/2005

10.4 Test Result

The maximum Conducted Power (CP) is 2.443W

Calculation Formula: $CP = R + A + L$

* Note:

CP: The final Conducted Power

R : The reading value from spectrum analyzer

A : The attenuation value of the used attenuator

L : The loss of all connection cables

In the test: A= 10 dB, L=0.13 dB and the maximum R= 130.91 dBuV,
So $CP = 130.91 + 9.84 + 0.13 = 140.88 \text{ dBuV} = 2.443\text{W}$

Conducted Power of CH 01**Conducted Power of CH 02**

Conducted Power of CH 03

10.5 Conduct spurious plot

Conduct spurious plot of CH 01

Conduct spurious plot of CH 02

Conduct spurious plot of CH 03

11 TRANSMITTER FREQUENCY BEHAVIOR**11.1 Provisions Applicable**
