

FCC Part 101 Multiple Address System Transmitter Certification

Test Report

FCC ID: SDBAMDS1000TR

FCC Rule Part: CFR 47 Part 101 Subpart C

ACS Report Number: 04-0166-101

Manufacturer: AMDS.
Equipment Type: Electricity Meter Transmitter
Model: AMDS-1000TR

Test Begin Date: June 1, 2004
Test End Date: August 11, 2004

Report Issue Date: August 13, 2004

FOR THE SCOPE OF ACCREDITATION UNDER LAB Code 200612

1.0 GENERAL

1.1 Purpose

The purpose of this report is to demonstrate compliance with Part 2 Subpart J and Part 24 Subpart D of the FCC's Code of Federal Regulations.

1.2 Product Description

The AMDS-1000TR iCon Transceiver is a printed circuit board that provides wireless communication capability to the Invensys™ iCon family of electric utility meters.

The device mounts into existing iCon meters and acts as the "Integrated Communications Device". The device monitors meter reading and diagnostic information via an UI 1203 serial interface to the iCon display board. Power failures are detected via a Power Failure active low signal also from the iCon display board. The device communicates via the AMDS fixed wireless telemetry network to provide electric meter readings and diagnostic data from the meter to the utility provider via a two-way radio link.

The AMDS-1000TR transceiver utilizes a printed antenna. The transceiver antenna has a VSWR bandwidth of 50 MHz, enough to cover the 901 to 942 MHz transmitter and receiver operating frequency range. The antenna is a printed monopole with a gain of 0 dBi.

The AMDS-100TR operates as a Multiple Address System on 2 frequencies in accordance 101.101. The channel frequencies are 932.23125 MHz and 941.23125MHz.

Detailed photographs of the EUT are filed separately with this filing.

1.3 Emission Designators

The AMDS iCon Transceiver produces three distinct modulation formats. They are described as Normal mode, Boost mode and MPass mode.

The emissions designators for the three modulation types used by the AMDS iCon Transceiver are as follows:

Normal Mode: 9K60F2D
Boost Mode: 1K10F2D
MPass Mode: 5K90F1D

1.4 Necessary Bandwidth Calculations

REF: "Bandpass FSK Modulation" AMDS LLC Internal Working Paper

Online NTIA Document: <http://www.ntia.doc.gov/osmhome/redbook/J.pdf> "Guidance for Determination of Necessary Bandwidth"

Assuming Multi Level Frequency Shift Keying FM Modulation:

$$B_n = (R/\log_2(S)) + 2DK$$

Where:

B_n = Necessary Bandwidth

R = Digital Information Rate

D = Deviation (Peak) of the FM Signal

S = Number of Equivalent Non-Redundant Signaling States

K = Numerical Factor That Varies According to the Emission and Allowable Signal Distortion.

FOR NORMAL MODE:

Referring to the AMDS LLC Working Paper and Utilizing an 8.0455 Kb / Sec Baud Rate On-Air (Normal Mode):

$R = 8.0455 \text{ kHz}$ (Bit Rate).

$D = 3.75 \text{ kHz}$ (Peak Deviation from carrier – Beta of 1.86)

$K = 1$

$S = 16$

$B_n = (8.0455 \text{ kHz} / 4) + 2(3.75 \text{ kHz})(1) = 9.511375 \text{ kHz}$

Emissions Designator: 9K60F2D

FOR BOOST MODE:

Referring to the AMDS LLC Working Paper and Utilizing a 0.80455 Kb / Sec Baud Rate On Air (Boost Mode):

$R = 0.80455 \text{ kHz}$ (Bit Rate).

$D = 0.440 \text{ kHz}$ (Peak Deviation from carrier – Beta of 2.2)

$K = 1$

$S = 16$

$B_n = (0.80455 \text{ kHz} / 4) + 2(0.440 \text{ kHz})(1) = 1.0811375 \text{ kHz}$

Emissions Designator: 1K10F2D

FOR mPASS MODE:

MPASS Modulation differs from both Boost Mode and Normal Mode. MPASS is a two level GFSK/GMSK signal with a $BT = 0.5$. The modulation is filtered in the transmitter providing bandwidth reduction. The Beta of the modulation is 0.5 (producing GMSK/GFSK). The document referenced provides only a necessary bandwidth equation for 2-ary MSK. We will use this to determine our necessary bandwidth for the emissions designator although a lower bandwidth may actually be computed.

$B_n = R * 1.18$

MPASS utilizes a 5.0Kb on air data rate, thus:

$B_n = 5.0 \text{ kHz} * 1.18$

$B_n = 5.9 \text{ KHz}$

Emissions Designator: 5K90F1D

2.0 LOCATION OF TEST FACILITY

All testing was performed by qualified ACS personnel located at the following address:

Advanced Compliance Solutions
5015 B.U. Bowman Drive
Buford, GA 30518
Phone: (770) 831-8048
Fax: (770) 831-8598

Both sites have been fully described and submitted to, and accepted by the FCC and Industry Canada. FCC registration number 89450 and Industry Canada Lab Code IC 4175 have been assigned in recognition of the sites

2.1 DESCRIPTION OF TEST FACILITY

Both the Open Area Test Site(OATS) and Conducted Emissions site have been fully described, submitted to, and accepted by the FCC, Industry Canada and the Japanese Voluntary Control Council for Interference by information technology equipment.

The following certification numbers have been issued in recognition of these accreditations and certifications:

FCC Registration Number: 89450
Industry Canada Lab Code: IC 4175
VCCI Member Number: 1831
▪ VCCI OATS Registration Number R-1526
▪ VCCI Conducted Emissions Site Registration Number: C-1608
NVLAP Lab Code: 200612

2.1.1 Open Area Test Site

The open area test site consists of a 40' x 66' concrete pad covered with a perforated electro-plated galvanized sheet metal. The perforations in the sheet metal are 1/8" holes that are staggered every 3/16". The individual sheets are placed to overlap each other by 1/4" and are riveted together to provide a continuous seam. Rivets are spaced every 3" in a 3 x 20 meter perimeter around the antenna mast and EUT area. Rivets in the remaining area are spaced as necessary to properly secure the ground plane and maintain the electrical continuity.

The entire ground plane extends 12' beyond the turntable edge and 16' beyond the antenna mast when set to a 10 meter measurement distance. The ground plane is grounded via 4 - 8' copper ground rods, each installed at a corner of the ground plane and bound to the ground plane using 3/4" stainless steel braided cable.

The turntable is an all aluminum 10' flush mounted table installed in an all aluminum frame. The table is remotely operated from inside the control room located 40' from the range. The turntable is electrically bonded to the surrounding ground plane via steel fingers installed on the edge of the turn table. The steel fingers make constant contact with the ground plane during operation.

Adjacent to the turntable is a 7' x 7' square and 4' deep concrete pit used for support equipment if necessary. The pit is equipped with 5 - 4" PVC chases from the pit to the control room that allow for cabling to the EUT if necessary. The underside of the turntable can be accessed from the pit so cables can be supplied to the EUT from the pit. The pit is covered with 2 sheets of 1/4" diamond style re-enforced steel sheets. The sheets are painted to match the perforated steel ground plane, however the underside edges have been masked off to maintain the electrical continuity of the ground plane. All reflecting objects are located outside of the ellipse defined in ANSI C63.4.

A diagram of the Open Area Test Site is shown in Figure 2.1.1-1 below:

Figure 2.1.1-1: Open Area Test Site

2.1.2 Conducted Emissions Test Site Description

The AC mains conducted EMI site is a shielded room with the following dimensions:

- Height: 3.0 Meters
- Width: 3.6 Meters
- Length: 4.9 Meters

The room is manufactured by Rayproof Corporation and installed by Panashield, Inc. Earth ground is provided to the room via an 8' copper ground rod. Each panel of the room is connected electrically at intervals of 4".

Power to the room is filtered to prevent ambient noise from coupling to the EUT and measurement equipment. Filters are models 1B42-60P manufactured by Rayproof Corporation.

The room is of sufficient size to test table top and floor standing equipment in accordance with section 6.1.4 of ANSI C63.4.

A diagram of the room is shown below in figure 2.1.2-1:

Figure 2.1.2-1: AC Mains Conducted EMI Site

3.0 APPLICABLE STANDARD REFERENCES

The following standards were used:

- 1 - ANSI C63.4-1992: Method of Measurements of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the 9KHz to 40GHz
- 2 - US Code of Federal Regulations (CFR): Title 47, Part 2, Subpart J: Equipment Authorization Procedures (October 2003)
- 3 - US Code of Federal Regulations (CFR): Title 47, Part 24, Subpart D: Personal Communication Service, Narrowband PCS (October 2003)

4.0 LIST OF TEST EQUIPMENT

All test equipment used for regulatory testing is calibrated yearly or according to manufacturer's specifications.

6.0 EQUIPMENT UNDER TEST SETUP AND BLOCK DIAGRAM

Figure 6-1: EUT Test Setup

The EUT was powered by two external DC power supplies as shown above. The DB9 connector was used to connect to a PC for programming the EUT test modes. The PC was removed prior to testing.

* For RF conducted measurements the AMDS iCon Transceiver was modified with an external RF connector to the PCB. The AMDS iCon Transceiver utilizes a printed antenna integral to the transceiver PCB for normal operation but for testing purposes a 50-Ohm test point (TP2) is available on the bottom of the PCB. The test point provides proper power level measurements only when the antenna is disconnected and a 50-Ohm test cable is soldered (with the appropriate ground connection) to TP2.

7.0 SUMMARY OF TESTS

Along with the tabular data shown below, plots were taken of all signals deemed important enough to document.

7.1 RF Power Output - FCC Section 2.1046

7.1.1 Measurement Procedure

The RF output of the equipment under test was directly connected to the input of the E7402A Spectrum Analyzer through a 10 dB passive attenuator. The resolution and video bandwidths of the spectrum analyzer were set at sufficient levels, >> signal bandwidth, to produce accurate results. The internal correction factors of the spectrum analyzer were employed to correct for any cable or attenuator losses. Results are shown below in Table 7.1.1-2 and Figure 7.1.1-1 through 7.1.1-2.

7.1.2 Measurement Results

7.2 Occupied Bandwidth (Emission Limits) - FCC Section 2.1049, 101.111 a(6)**7.2.1 Measurement Procedure**

The RF output of the equipment under test was directly connected to the input of the E7402A Spectrum Analyzer through a 10 dB passive attenuator. The spectrum analyzer resolution and video bandwidths were set to 300 Hz. The internal correction factors of the spectrum analyzer were employed to correct for any cable or attenuator losses. Results of the test are shown below in Figure 7.2.2-1 through 7.2.2-7 for all modes of operation.

7.3 Spurious Emissions at Antenna Terminals - FCC Section 2.1051, 101.111 a (6)

7.3.1 Measurement Procedure

The RF output of the equipment under test was directly connected to the input of the Spectrum Analyzer through a 20 dB passive attenuator. The spectrum analyzer resolution and video bandwidths were set to 10 kHz / 30 kHz below 1000 MHz and 1 MHz / 3 MHz above 1000 MHz according to TIA 603-A-2001. The internal correction factors of the spectrum analyzer were employed to correct for any cable or attenuator losses. The spectrum was investigated in accordance to CFR 47 Part 2.1057.

7.3.2 Measurement Results

The magnitude of all spurious emissions were attenuated more than 20 dB below the permissible value and therefore not specified in this report (2.1051). Worst case emission plots supplied in Figure 7.3.2-1 through 7.3.2.4.

Figure 7.3.2-1: Normal Mode –932.23125 MHz

Figure 7.3.2-4: Normal Mode -941.23125 MHz

7.4 Field Strength of Spurious Emissions - FCC Section 2.1053, 24.133

7.4.1 Measurement Procedure

The equipment under test is placed on the Open Area Test Site (described in section 2.1) on a wooden table at the turntable center. For each spurious emission, the antenna mast is raised and lowered from one (1) to four (4) meters and the turntable is rotated 360° and the maximum reading on the spectrum analyzer is recorded. This repeated for both horizontal and vertical polarizations of the receive antenna.

The equipment under test is then replaced with a substitution antenna fed by a signal generator. The signal generator's frequency is set to that of the spurious emission recorded from the equipment under test. The antenna mast is raised and lowered from one (1) to four (4) meters to obtain a maximum reading on the spectrum analyzer. The output of the signal generator is then adjusted until the reading on the spectrum analyzer matches that obtained from the equipment under test. The signal generator level is recorded.

The power in dBm of each spurious emission is calculated by correcting the signal generator level for the cable loss and gain of the substitution antenna referenced to a dipole. The spectrum was investigated in accordance to CFR 47 Part 2.1057.

Results of the test are shown below in Table 7.4.2-1.

7.4.2 Measurement Results

7.5 Frequency Stability - FCC Section 2.1055, 24.135**7.5.1 Measurement Procedure**

The equipment under test is placed inside an environmental chamber. The RF output is directly coupled to the input of the measurement equipment and a power supply is attached to the primary supply voltage.

Frequency measurements were made at the extremes of the of temperature range -30° C to +50° C and at intervals of 10° C at normal supply voltage. A period of time sufficient to stabilize all components of the equipment was allowed at each frequency measurement. At a temperature 20° C the supply voltage was varied from 85% to 115% from the normal. The maximum variation of frequency was recorded.

Results of the test are shown below in Table 7.5.2-1 through 7.5.2-3 for all modes of operation.

7.6 Radiated Emissions (Unintentional Radiators) - FCC Section 15.109

7.6.1 Measurement Procedure

The equipment under test is placed on the Open Area Test Site (described in section 2.1) on a wooden table at the turntable center. For each radiated emission, the antenna mast is raised and lowered from one (1) to four (4) meters and the turntable is rotated 360° to obtain a maximum peak reading on the spectrum analyzer. The radiated emissions are then measured using an EMI receiver employing a CISPR quasi-peak detector for frequencies below 1000 MHz and an Average detector function for frequencies above 1000 MHz. This repeated for both horizontal and vertical polarizations of the receive antenna.

The field strength of each radiated emission is calculated by correcting the EMI receiver level for cable loss, amplifier gain, and antenna correction factors.

Field Strength (dBuV/m) = EMI Receiver Level (dBuV) + Cable Loss (dB) – Amplifier Gain (dB) + Antenna Correction Factor (1/m)

Results of the test are shown below in Table 7.6.2-1.

7.6.2 Measurement Results

7.7 Power Line Conducted Emissions - FCC Section 15.107

7.7.1 Measurement Procedure

Conducted emissions were performed from 150kHz to 30MHz with the spectrum analyzer's resolution bandwidth set to 9kHz and the video bandwidth set to 30kHz. The calculation for the conducted emissions is as follows:

Corrected Reading = Analyzer Reading + LISN Loss + Cable Loss

Margin = Corrected Reading – Applicable Limit

Results of the test are shown below in and Tables 7.7.2-1 through 7.7.2-4 and Figure 7.7.2-1 through 7.7.2-2

7.7.2 Measurement Results

Table 7.7.2-1: Line 1 Conducted EMI Results (Quasi-Peak)

Frequency MHz	Level dBμV	Transducer dB	Limit dBμV	Margin dB	Line	PE
0.456	37.6	9.5	56.7	19.1	L1	GND
0.606	39.3	9.5	56	16.6	L1	GND
0.756	38	9.5	56	17.9	L1	GND
1.056	35.7	9.6	56	20.2	L1	GND
