1.4 Product Information

1.4.1 Technical Description

The equipment under test was the CPTP100A which is a test point to be used with Cathodic Protection. The device will measure, filter, and alert on AC voltage detected on a gas pipeline.

Technical Details

Mode of Operation: Flexnet Radio
 Frequency Range: 901 - 960 MHz
 Antenna Type/Gain: PCB Trace Folded monopole / 0 dBi
 Input Power: 3.6 VDC

The CPTP100A transmitters produce 6 distinct modulation formats. The emissions designators for the modulation types used by the CPTP100A transmitters are as follows:

EMISSIONS DESIGNATORS:

Normal Mode: 9K60F2D (7-FSK)
 Double Density Mode: 9K60F2D (13-FSK)
 C&I Mode: 4K80F2D (7-FSK)
 Boost Mode: 1K10F2D (7-FSK)
 MPass Mode (5 kbps): 5K90F1D (2-GFSK)
 MPass Mode (10 kbps): 11K8F1D (2-GFSK)

A full description and detailed product specification details are available from the manufacturer.

1.4.2 Modes of Operation

The tested mode of operation was the Flexnet radio in continuous transmit mode. The EUT was configured using the Sensus FieldLogic NAMU 2.4.34.0 software tool. The TX output power of the radio was not configurable.

1.4.3 Monitoring of Performance

The following performance attributes were monitored:

1. Transmitter Output Power
2. Transmitter Emissions Masks
3. Transmitter Occupied Bandwidth
4. Transmitter Spurious Emissions at the Antenna Port
5. Transmitter Radiated Spurious Emissions
6. Transmitter Frequency Stability over Temperature and Voltage

The EUT offers two TCXO alternate parts (KDS, TXC). Full testing was performed on one TCXO variant while spot check measurements were performed on the second variant as deemed applicable.

The EUT was configured with power leads for testing purposes. The RF conducted measurements were performed for the EUT configured with an RF connector at the antenna port to allow direct coupling to a spectrum analyzer.

The EUT is designed to operate in multiple bands under the requirements of CFR 47 Parts 24 and 101. The following is a list of the frequency bands of operation sorted based on the FCC rule parts in which the band is associated.

CFR Title 47 Rule Part	ISED Canada RSS	Frequency Band of Operation (MHz)
24D	134	901.0 - 902.0
24D	134	930.0 - 931.0
24D	134	940.0 - 941.0
101	119	928.85 - 929.0
101	119	932.0 - 932.5
101	119	941.0 - 941.5
101	N/A	959.85 - 960.0

Based on the requirements set forth in accordance 47 CFR 2.1046-2.1057 as stated above, the methodology in selecting the places to test in the available bands of operation is outlined in the following table.

CFR Title 47 Rule Part	ISED Canada RSS	Frequency Band of Operation (MHz)	Location in the Range of Operation	Approx. Test Freq.
24D	134	901.0 - 902.0	Middle	901.5000

The RF output of the equipment under test was directly connected to the input of the Spectrum Analyzer through suitable of passive attenuation. The internal correction factors of the spectrum analyzer were employed to correct for any cable and attenuator losses.

The spectrum analyzer center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be set wide enough to capture all modulation products including the emission skirts. The nominal IF filter 3 dB bandwidth (RBW) is in the range of 1% to 5% of the OBW, and the VBW was set $\geq 3 \times$ RBW. The reference level was set to prevent the signal amplitude from exceeding the maximum spectrum analyzer input mixer level for linear operation. The measurements were made using the spectrum analyzer's 99% BW function.

The RF output of the equipment under test was directly connected to the input of the Spectrum Analyzer through a 30 dB passive attenuator. The spectrum analyzer resolution bandwidth was set to 100 kHz below 1000 MHz and 1 MHz above 1000 MHz. The internal correction factors of the spectrum analyzer were employed to correct for any cable or attenuator. The spectrum was investigated in accordance with CFR 47 Part 2.1057

2.5.3 Date of Test

2024-October-17 to 2024-October-26

2.5.4 Test Method

The EUT was evaluated in accordance to ANSI C63.26:2015 Section 5.5.3 Measurement of Spurious Emissions using Substitution Method.

Radiated emissions tests were made over the frequency range of 30 MHz to 10 times the highest fundamental frequency. The equipment under test is placed in the Semi-Anechoic Chamber on a RF transparent table at the turntable center. For each spurious emission, the antenna mast is raised and lowered from one (1) to four (4) meters and the turntable is rotated 360° and the maximum reading on the spectrum analyzer is recorded. This was repeated for both horizontal and vertical polarizations of the receive antenna.

The equipment under test is then replaced with a substitution antenna fed by a signal generator. The signal generator's frequency is set to that of the spurious emission recorded from the equipment under test. The antenna mast is raised and lowered from one (1) to four (4) meters to obtain a maximum reading on the spectrum analyzer. The output of the signal generator is then adjusted until the reading on the spectrum analyzer matches that obtained from the equipment under test. The signal generator level is recorded. The power in dBm of each spurious emission is calculated by correcting the signal generator level for the cable loss and gain of the substitution antenna referenced to a dipole. The spectrum was investigated in accordance to FCC CFR 47 Part 2.1057.

The magnitude of all spurious emissions not reported were attenuated below the noise floor of the measurement system and therefore not specified in this report. Results are shown below.

2.5.7 Sample Calculations

$$\text{ERP} = \text{Pgen} - \text{Cables Loss} + \text{Substitution Antenna Gain [dBd]}$$

Where:

ERP is the EUT radiated Power in dBm

Pgen is the signal generator setting [dBm]

Cable Loss is the Transmit cable loss [dB]

Substitution Antenna Gain [dBd] = $10 \text{ Log (antenna numeric gain) } - 2.15$.

Example Calculation

Radiated Power: $-52 - 7.16 + 7.862 = -51.298 \text{ dBm}$

Margin: $-13 - (-51.298) = 38.298 \text{ dBm}$

2.6.4 Test Method

The equipment under test is placed inside an environmental chamber. The RF output is directly coupled to the input of the measurement equipment and a power supply is attached to the primary supply voltage.

Frequency measurements were made at the extremes of the of temperature range -30° C to +50° C and at intervals of 10° C at normal supply voltage. Sufficient time to stabilize all components of the equipment was allowed at each frequency measurement. At a temperature 20° C the supply voltage was reduced to the battery operating endpoint. The maximum variation of frequency was recorded.

5 Measurement Uncertainty

For a 95% confidence level, the measurement uncertainties for defined systems are:

Table 5-1 - Values of U_{CISPR} and U_{Lab}

Measurement	U_{CISPR}	U_{Lab}
Conducted disturbance (mains port) (9 kHz – 150 kHz) (150 kHz – 30 MHz)	3.8 dB 3.4 dB	3.71 dB 3.31 dB
Conducted disturbance (telecom port) (150 kHz – 30 MHz 55 dB LCL) (150 kHz – 30 MHz 65 dB LCL) (150 kHz – 30 MHz 75 dB LCL)	5.0 dB 5.0 dB 5.0 dB	4.11 dB 4.50 dB 4.94 dB
Radiated disturbance (electric field strength on an open area test site or alternative test site) (30 MHz – 1 000 MHz) (1 – 6 GHz) (6-18 GHz)	6.3 dB 5.2 dB 5.5 dB	5.94 dB 5.07 dB 5.07 dB

Notes:

U_{CISPR} resembles a value of measurement uncertainty for a specific test, which was determined by considering uncertainties associated with the quantities listed in CISPR 16-4-2:2011.
