ACCREDITATION, LISTINGS & RECOGNITION

TESTING ACCREDITATION

MiCOM Labs, Inc. is an accredited Electrical testing laboratory per the international standard EN ISO/IEC 17025. The company is accredited by the American Association for Laboratory Accreditation (A2LA) www.a2la.org test laboratory number 2381.01. MiCOM Labs test schedule is available at the following URL; <http://www.a2la.org/scopepdf/2381-01.pdf>

The American Association for Laboratory Accreditation

World Class Accreditation

Accredited Laboratory

A2LA has accredited

MICOM LABS

Pleasanton, CA

for technical competence in the field of

Electrical Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2005 *General Requirements for the Competence of Testing and Calibration Laboratories*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communiqué dated 8 January 2009).

Presented this 14th day of April 2010.

2.2. Test and Uncertainty Procedures

Conducted and radiated emission measurements were conducted in accordance with American National Standards Institute ANSI C63.4, listed in the Normative References section of this report.

Measurement uncertainty figures are calculated in accordance with ETSI TR 100 028 Parts 1 and 2.

Measurement uncertainties stated are based on a standard uncertainty multiplied by a coverage factor $k = 2$, providing a level of confidence of approximately 95 % in accordance with UKAS document M 3003 listed in the Normative References section of this report.

3.2. Scope of Test Program

The scope of the test program was to test the Sensus U905458B for compliance against the following standards:-

FCC 47 CFR Part 24, Subpart D requirements

FCC 47 CFR Part 90, Subpart I requirements.

FCC 47 CFR Part 101, Subpart C requirements.

Modular Approval

The test program addressed the Sensus U905458B product for limited modular approval.

Test Frequencies

For testing in accordance with 47 CFR 2.1046-2, 1057, FCC OET recommends the following is used to select test frequencies for licensed devices;

Frequency Range of Device	Number of Selected Frequencies	Location in Range of Operation
1 MHz or less	1	Middle
1 to 10 MHz	2	1 near top and 1 near bottom
10 to 100 MHz	3	1 near top, 1 near middle, 1 near bottom

Test Set-Up

Test software was available to exercise the Access Point and the equipment was tested using the following test configuration.

General Test Set-Up

3.7. Equipment Modifications

The following modifications were required to bring the equipment into compliance:

1. Modulation Issue

When the equipment was initially delivered only a single modulation could be selected. Updated unit arrived 5th November 2010 to complete modulation V's Spectrum mask.

3.8. Deviations from the Test Standard

The following deviations from the test standard were required in order to complete the test program:

1. NONE

3.9. Subcontracted Testing or Third Party Data

1. NONE

Test Procedure

The transmitter output was connected to a spectrum analyzer and the Occupied Bandwidth was measured with a modulated carrier.

Occupied Bandwidth was measured under ambient conditions, nominal voltage for all modulations and rule parts on low, mid and high channels. The spectrum analyzer RBW and VBW was set for 300 Hz which was based on the bandwidth of the output spectrum.

To position the mask relative to the output spectrum the EUT was initially set to transmit a CW (single) tone at the frequency of interest. The mask was then lined up with the peak of the CW tone. The EUT then was then set to modulate each modulation of interest and measurements reported.

Spectrum mask parameters were generated using the attenuation characteristics which were found in each rule part as highlighted for 12.5 kHz. The spectrum analyzer pass/fail criteria was used to determine compliance which is clearly marked on each plot provided. The automatic bandwidth function within the analyzer was used to determine 99% bandwidth.

5.1.3. Frequency Stability; Temperature Variations, and Voltage Variations

FCC 47 CFR Sections 2.1055, 24.135, 90.213, 101.107
IC RSS-134 (7), RSS-119 (5.3)

Test Procedure

The EUT was placed inside an environmental chamber. The transmitter output was connected to a spectrum analyzer and the frequency stability was measured using a unmodulated (CW) single tone. A thermocouple was used to monitor chamber temperature. The EUT was attached to a variable power supply providing the primary supply voltage.

Frequency stability was measured through the extremes of temperature and voltage on the mid channel of each frequency band. Before measurements were taken at each temperature the equipment waited until thermal balance was obtained.

At +20°C the primary voltage was varied $\pm 15\%$ and measurements were taken at each voltage level.

Test Set-up is shown in Section 3.6 Test Configuration

Maximum Frequency Drift with respect to the nominal frequency		-224.36 Hz / +87.13 Hz -0.24 ppm / +0.09 ppm		

Limits

§ 24.135 Frequency stability

(a) The frequency stability of the transmitter shall be maintained within ± 0.0001 percent (± 1 ppm) of the center frequency over a temperature variation of -30° Celsius to $+50^{\circ}$ Celsius at normal supply voltage, and over a variation in the primary supply voltage of 85 percent to 115 percent of the rated supply voltage at a temperature of 20° Celsius.

(b) For battery operated equipment, the equipment tests shall be performed using a new battery without any further requirement to vary supply voltage.

(c) It is acceptable for a transmitter to meet this frequency stability requirement over a narrower temperature range provided the transmitter ceases to function before it exceeds these frequency stability limits.

Test Procedure

The transmitter output was connected to a spectrum analyzer and the Spurious Emissions were measured using an un-modulated carrier.

Spurious Emissions were measured under ambient conditions, nominal voltage for all rule parts on low and high channels for the particular frequency band.

The limit line was calculated from the attenuation characteristics found within each rule part.

5.1.5. Maximum Permissible Exposure

FCC, Part 1 Subpart §1.1310

Calculations for Maximum Permissible Exposure Levels

$$\text{Power Density} = P_d (\text{mW/cm}^2) = \text{EIRP}/(4\pi d^2)$$

$$\text{EIRP} = P * G$$

P = Peak output power (mW)

G = Antenna numeric gain (numeric)

d = Separation distance (cm)

$$\text{Numeric Gain} = 10^{(G (\text{dBi})/10)}$$

The calculated separation distance is for worst case i.e. highest power level.

Because the EUT belongs to the General Population/Uncontrolled Exposure the limit of power density is $f/1500$ (where $f = 896 \text{ MHz}$) = 0.6 mW/cm^2

Freq. Band (GHz)	Antenna Gain (dBi)	Numeric Gain (numeric)	Max Peak Output Power (dBm)	Peak Output Power (mW)	Calculated Safe Distance @ 0.6 mW/cm^2 Limit(cm)	Minimum Separation Distance (cm)
900	3.0	2.00	+29.84	963.9	16	20

*Note: for mobile or fixed location transmitters the minimum separation distance is 20cm, even if the calculations indicate the MPE distance to be lower.

Specification

Maximum Permissible Exposure Limits

§1.1310 Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency levels in excess of the Commission's guidelines. See §1.1307 (b)(1) of this chapter.

Limit = $0.6 \text{ mW} / \text{cm}^2$ from 1.310 Table 1

Note: for mobile or fixed location transmitters the minimum separation distance is 20cm, even if calculations indicate the MPE distance to be less.

5.1.6. Radiated Spurious Emissions

5.1.6.1. Transmitter Radiated Emissions above 1 GHz

FCC 47 CFR Part 24 Subpart 24.133 a(1), a(2)

FCC 47 CFR Part 90 Subpart 90.210 (j)

FCC 47 CFR Part 101 Subpart 101.111 a(6)

ANSI/TIA-603

IC RSS-134 6.3 (i), (ii)

IC RSS-119 5.8.6

Test Procedure

Test was performed on a CW (continuous) carrier at the maximum allowed output power at the appropriate center frequency. Substitution was performed on any emissions observed within 6 dB of the limit.

The measurement equipment was set to measure in peak hold mode. The emissions were measured in the anechoic chamber at a 3-meter distance on every azimuth in both horizontal and vertical polarities. The emissions are recorded and maximized as a function of azimuth by rotation through 360° with a spectrum analyzer in peak hold mode.

The highest emissions relative to the limit were then further evaluated using substitution methodology.

Substitution Methodology

Upon completion of the above for all emission frequencies found:

- a) Replace the EUT with a signal generator connected to a substitution antenna
- b) To provide a better impedance match for the signal generator place a 3dB attenuator on the antenna port
- c) Depending on the standard frequencies below 1GHz may require the use of the dipole antenna
 - for the frequency of interest set the length of the dipole antenna per the manufacturers setting
- d) For each emission noted set the antenna to the appropriate polarization and tune the signal generator to match the frequency of interest
- e) Where required raise / lower the measurement antenna, if necessary, to maximize the emission.
- f) Adjust the input signal to the substitute antenna until a known related level to that detected from the EUT is obtained at the receiver or spectrum analyzer.
- g) Correct the above level for the substitution antenna gain and any path loss present to find the radiated spurious emission at this frequency.

EUT emission = Sig. gen output power – cable loss + transmitting antenna gain (dBi)

dBi = $10 \log$ (antenna numeric gain), dBi is with respect to an isotropic radiating antenna

Sample calculation

Sig. Gen output power = -21.2dBm

Cable loss = 4.25dB

Antenna numeric gain = 7.3

EUT spurious emission power level = $-21.2 - 4.25 + 10 \log (7.3)$

EUT spurious emission = -16.8dBm

Record the frequency of emission, power level and measurement bandwidth.

Limit

The worst case limit for all applicable CFR Parts were applied during radiated testing.

5.1.6.2. Transmitter Radiated Spurious Emissions (30M-1 GHz)

FCC, Part 15 Subpart C §15.205/ §15.209

Industry Canada RSS-111 §4.4

RSS Gen 6

Test Procedure

Preliminary radiated emissions were measured in the anechoic chamber at a 10-meter distance on every azimuth in both horizontal and vertical polarity. The emissions are recorded with a spectrum analyzer in peak hold mode. Emissions closest to the limits are measured in the quasi-peak mode with the tuned receiver using a bandwidth of 120 kHz. Only the highest emissions relative to the limit are listed. The anechoic chamber test set-up is identified in Section 6 Test Set-Up Photographs.

Test Measurement Set up

Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. In this test facility, the Antenna Factor, Cable Loss, and Amplifier Gains are loaded into the Rohde & Schwarz Receiver and the corrected field strength can be read directly on the receiver.

$$FS = R + AF + CORR$$

where:

FS = Field Strength

R = Measured Receiver Input Amplitude

AF = Antenna Factor

CORR = Correction Factor = CL – AG + NFL

CL = Cable Loss

AG = Amplifier Gain

For example:

Given a Receiver input reading of 51.5dB μ V; Antenna Factor of 8.5dB; Cable Loss of 1.3dB; Falloff Factor of 0dB, an Amplifier Gain of 26dB and Notch Filter Loss of 1dB. The Field Strength of the measured emission is:

$$FS = 51.5 + 8.5 + 1.3 - 26.0 + 1 = 36.3\text{dB}\mu\text{V/m}$$

Conversion between dB μ V/m (or dB μ V) and μ V/m (or μ V) are done as:

$$\text{Level (dB}\mu\text{V/m)} = 20 * \text{Log (level (\mu V/m))}$$

$$40 \text{ dB}\mu\text{V/m} = 100\mu\text{V/m}$$

$$48 \text{ dB}\mu\text{V/m} = 250\mu\text{V/m}$$

Specification

Limits

§15.205 (a) Except as shown in paragraph (d) of 15.205 (a), only spurious emissions are permitted in any of the frequency bands listed.

§15.205 (a) Except as shown in paragraphs (d) and (e) of this section, the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in Section §15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in Section 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in Section 15.35 apply to these measurements.

§15.209 (a) Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table.

5.1.7. AC Wireline Conducted Emissions (0.15 – 30 MHz)

FCC, Part 15 Subpart C §15.207

Industry Canada RSS-Gen §7.2.2

Test Procedure

The EUT is configured in accordance with ANSI C63.4. The conducted emissions are measured in a shielded room with a spectrum analyzer in peak hold in the first instance. Emissions closest to the limit are measured in the quasi-peak mode (QP) with the tuned receiver using a bandwidth of 9 kHz. The emissions are maximized further by cable manipulation. The highest emissions relative to the limit are listed.

Limit

§15.207 (a) Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50 $\mu\Omega$ line impedance stabilization network (LISN), see §15.207 (a) matrix below. Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal.
