1 EUT Details

1.1 General

The EUT was Ubisensor which contains a radio transceiver operating within the frequency band 908.37MHz to 915MHz.

The Ubisensor was considered as a composite device consisting of:

- o a transmitter (and its associated control circuitry)
- o a receiver (contained within the transceiver circuit)
- o a Class A digital device

The transmitter is subject to Certification Authorisation. The class A digital device and the receiver are subject to Verification Authorisation (see section 15.101b of CFR 47)

This report concentrates only on the transmitter section of the composite device (although emissions were measured from both the transmitter circuit and the active parts of the digital device).

The Ubisensor was considered as an intentional radiator operating under the rules of section 15.249 of CFR 47.

The device has two antennae which are internal to the system. Tests were performed with both antennae - an internal switch was used to select between the two.

The maximum clock frequency of the digital circuitry used to control the transmitter was 14.7456MHz. The maximum clock frequency of the Class A digital device circuitry was 315MHz.

Details of the EUT and associated peripherals used during the tests are listed below. Figure 1 shows the interconnections between the EUT and peripherals.

Item	Manufacturer	Model	Description	Serial No:	Notes
	Ubisense	Ubisensor	EUT		
	Stontronics	EPA-121DA-12	power adaptor		

	Report No: R1908 Issue No: 1	FCC ID: SEAUBISENSOR10	
	Test No: T1334	Test Report	Page: 6 of 37

1.2 Details of Interconnecting Cables

The following table lists details of the cables connected to the EUT.

From	To	Cable Type	Length	Notes
EUT power adaptor	power adaptor	unscreened 2 core	1.8m	
	ac power	unscreened 2 core	1.8m	

1.3 Modifications to EUT and Peripherals

Details of any modifications that were required to achieve compliance are listed below. The modification numbers are referred to in the results sections as appropriate.

Mod No:	Details	Implemented for
0	Unmodified unit as submitted for testing.	

1.4 EUT Operating Modes

The EUT was tested in the following operating mode or modes. Generally, operating modes are chosen that will exercise the functions of the EUT as fully as possible and in a manner likely to produce maximum emission levels or susceptibility. Individual test result sheets reference the operating mode of the EUT.

Operating Mode	Details
1	Transmitting at 908.37MHz - using antenna A.
2	Transmitting at 908.37MHz - using antenna B.
3	Transmitting at 915MHz - using antenna A.
4	Transmitting at 915MHz - using antenna B.

3 Test Methods

3.1 Conducted Emissions - ac power

This section describes the general method of performing this test. The specific method used and any deviations from this general method are listed in the appropriate results section.

Bench top EUTs and peripheral equipment are normally placed on a 0.8m high non-conducting bench, positioned 0.4m from one of the metallic walls of a screened room. Floor standing EUTs are normally placed 0.1m above the metallic floor of the screened room. Mains leads are bundled so as not to exceed 1m.

The EUT is powered using a 50ohm/50uH Line Impedance Stabilisation Network (LISN). Peripherals are powered using a second a 50ohm/50uH LISN. These LISNs are bonded to the screened room floor.

With the correct supply voltage applied to the EUT scans are performed on both the live and neutral line outputs of the LISN using quasi-peak detection over the specified frequency range. The results of these scans are shown in the plots section at the end of the report.

Significant emissions identified by the scans are measured and the results tabulated. The table of results is shown in the conducted emissions results section.

An absorbing clamp as specified in CISPR16 is used to measure the disturbance power on each cable. A spectrum analyser is connected to the clamp in order to scan the emissions produced over the appropriate frequency range. Each connecting cable is measured individually - all other cables not required for correct operation are disconnected. The measured cable is extended in length to exceed 5m plus twice the length of the clamp. The results of the scans are shown in the plots included at the end of the report. Cables are moved in an attempt to find the configuration which produces highest emissions.

Significant emissions identified by the scans are measured and the results tabulated.

3.2 Radiated Emissions

This section describes the general method of performing this test. The specific method used and any deviations from this general method are listed in the appropriate results section.

Initial scans are performed in a semi-anechoic screened room. Scans are performed over the frequency range specified in the test standard with the antenna both horizontally and vertically polarised. During these scans the EUT and peripherals are rotated through 360°. Bench top EUTs are placed on a non-conducting bench at a height of 0.8m above the ground plane. Floor standing EUTs are placed 0.1m above the ground plane. The results of the scans are shown in the plots included at the end of the report. Cables are moved in an attempt to find the configuration which produces highest emissions.

Significant emissions identified by the scans are measured on an open area test site at the appropriate test distance. Maximised readings are obtained by rotating the EUT through 360° and adjusting the height of the antenna from 1m to 4m. Measurements are made with the antenna both horizontally and vertically polarised and the results tabulated.

4 Test Results

The following sections contain tabulated test results. Plots of various scans are included at the back of this section.

Results					Minimum Margin PASS/FAIL					4.4 dB	PASS			

Notes	Comments and Observations
	Results of scans shown in plot 1 and plot 2. Note: EUT was found to comply with class B limits. As the unit contained a Class A digital device, the higher class A limits could have been applied in which case the margin would have been greater.
