TEST OBJECT DATA

General EUT Description

This transceiver module will be used exclusively by the applicant (limited modular approval) in telemetry devices. These telemetry devices will be situated in environment where normally no persons are situated and will work without user interaction.

3.3 There is no data port allowing direct modulation of the transmitter.

5.2 Type of emission: 9K00F1D – channel spacing 12,5 kHz (selectable stepsize: 6,25 kHz / 12,5 kHz / 25 kHz)

The maximum symbol rate is 4000 symbols per second (2kHz maximum modulation frequency).
The maximum frequency deviation is set to 2,5 kHz (nominal 2,3kHz with $\pm 0,2$ kHz tolerance)
With $k=1$ the necessary bandwidth is calculated as: $B_N = 2M + 2DK = 4000 + 5000 = 9\text{kHz}$.

Details of the modulation scheme can be found in chapter 2.1.1 of the hardware description.

Frequency range: 450 – 470 MHz

Power range and Controls: There are NO user power controls, the output power is fixed to 468mW.

Maximum output power rating: 468 mW into whip antenna

DC Voltage and Current: 6,2 V nominal 10V maximum
 maximum current consumption: 0,59A

For radiated measurements a typical configuration was set up to demonstrate compliance in normal operation configuration:

The telemetry device was mounted at top of the normally used vertical mast of 1,5m height. The solar cell was mounted in the same height on the backside of the telemetry device and connected to it. The normally used antenna was directly connected to the device. A combined temperature/humidity sensor was connected to the device.

This setup is referred as "EUT" in the description of test setups.

The measurement of the transmitter output power was made conducted. The antennas used for radiated measurements were that supplied with the equipment when sold. In case of damage or for other reasons antennas should be replaced with same antenna type only.

Date of tests: 20th and 21st July 2015 and 19th December 2016.

LIMIT

5.5 and 5.8.3:

For transmitters designed to operate with a 12,5 kHz channel bandwidth in the frequency range 450-470 MHz, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

(1) On any frequency from the center of the authorized bandwidth f_0 to 5,625 kHz removed from f_0 :
Zero dB.

(2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 5,625 kHz but no more than 12,5 kHz: At least $7,27(f_d - 2,88 \text{ kHz})$ dB.

(3) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 12,5 kHz: At least $50 + 10 \log(P)$ dB or 70 dB, whichever is the lesser attenuation.

t ₃	± 6,25 kHz	5,0 ms	10,0 ms

¹ t_{on} is the instant when a 1 kHz test signal is completely suppressed, including any capture time due to phasing.

t_1 is the time period immediately following t_{on}

t_2 is the time period immediately following t_1

t_3 is the time period from the instant when the transmitter is turned off until t_{off}

t_{off} is the instant when the 1 kHz test signal starts to rise.

² If the transmitter carrier output power rating is 6 W or less, the frequency difference during the time periods t_1 and t_3 may exceed the maximum frequency difference for these time periods. The corresponding plot of frequency versus time during t_1 and t_3 shall be recorded in the test report.

AC Power-Lines Conducted Emission

§ 7.2.4 of RSS-Gen

LIMIT

The purpose of this test is to measure unwanted radio frequency currents induced in any AC conductor external to the equipment which could conduct interference to other equipment via the AC electrical network.

Except when the requirements applicable to a given device state otherwise, for any licence-exempt radiocommunication device equipped to operate from the public utility AC power supply, either directly or indirectly, the radio frequency voltage that is conducted back onto the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in Table 2. The tighter limit applies at the frequency range boundaries.

The conducted emissions shall be measured with a 50 ohm/50 microhenry line impedance stabilization network.

Table 2 - AC Power Lines Conducted Emission Limits

Frequency range (MHz)	Conducted limit (dBµV)	
	Quasi-peak	Average
0.15 – 0.5	66 to 56*	56 to 46*
0.5 – 5	56	46
5 – 30	60	50
