1. Appendix B

1.1. Test Procedures for Antenna Conducted Tests

Two versions of the EUT were provided, a version with a permanently attached antenna and the other, with an RF test port interface. The EUT RF design of both versions are identical. The RF conducted test measurements were performed using the EUT with the RF test port version. The radiated measurements were performed using the EUT version with the permanently mounted antenna.

The EUT with the permanently mounted antenna is the only version that is sold and /or marketed to the public.

1.1.3. 15.247(b)(2) Transmitter Peak Power

From paragraph; 1.1.1 (15.247(a) Carrier Frequency Separation), of this document the measured peak output power at 902.33MHz is +6.19 dBm. This was measured using the EUT with the RF test port interface. The maximum gain of the permanently mounted antenna is 2.7dBi

Therefore:

$$+6.19\text{dBm} + 2.7\text{dBi} = +8.89\text{dBm};$$

Which translates to a peak output of +7.745mW.
