

Test report

312742-3TRFWL

Date of issue: November 30, 2016

Applicant:

Seiko Epson Corporation

Product:

Smart Glasses

Model:

H756A (BT-300)

FCC ID:

SKSH756A

IC Registration number:

1052D-H756A

Specifications:

◆ **FCC 47 CFR Part 15 Subpart E, §15.407**

Unlicensed National Information Infrastructure Devices

◆ **RSS-247, Issue 1, Section 6, May 2015**

Digital Transmission Systems (DTSS), Frequency Hopping Systems (FHSs) and Licence-Exempt Local Area Network (LE-LAN) Devices

Test location

905462 D02	UNII DFS Compliance Procedures New Rules v02
ANSI C63.10 v2013	American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices

1.4 Statement of compliance

In the configuration tested, the EUT was found compliant.

Testing was completed against all relevant requirements of the test standard. Results obtained indicate that the product under test complies in full with the requirements tested. The test results relate only to the items tested.

See "Summary of test results" for full details.

1.5 Exclusions

None

1.6 Test report revision history

Revision #	Details of changes made to test report
TRF	Original report issued

Section 2. Summary of test results

2.1 FCC Part 15 Subpart C, general requirements test results

Part	Test description	Verdict
§15.31(e)	Variation of power source	Pass ¹
§15.203	Antenna requirement	Pass ²

Notes: ¹Measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, was performed with the supply voltage varied between 85 % and 115 % of the nominal rated supply voltage. No noticeable output power variation was observed

²The Antennas are located within the enclosure of EUT and not user accessible.

2.2 FCC Part 15 Subpart E, test results

Part	Test description	Verdict
§15.403(i)	Emission bandwidth	Not applicable
§15.407(a)(1)	Power and density limits within 5.15–5.25 GHz band	Not applicable
§15.407(a)(2)	Power and density limits within 5.25–5.35 GHz and 5.47–5.725 GHz bands	Pass
§15.407(a)(3)	Power and density limits within 5.725–5.85 GHz band	Not applicable
§15.407(b)(1)	Undesirable emission limits for 5.15–5.25 GHz band	Not applicable
§15.407(b)(2)	Undesirable emission limits for 5.25–5.35 GHz band	Pass
§15.407(b)(3)	Undesirable emission limits for 5.47–5.725 GHz bands	Not applicable
§15.407(b)(4)	Undesirable emission limits for 5.725–5.85 GHz band	Not applicable
§15.407(b)(6)	Conducted limits for U-NII devices using an AC power line	Pass
§15.407(e)	Minimum 6 dB bandwidth of U-NII devices within the 5.725–5.85 GHz band	Not applicable
§15.407(g)	Frequency stability	Pass
§15.407(h)(1) ¹	Transmit power control (TPC)	Not applicable ¹
§15.407(h)(2) ¹	Dynamic Frequency Selection (DFS)	Pass

Note: ¹EUT maximum EIRP is less than 500 mW (24 dBm), therefore a TPC mechanism is not required

2.3 IC RSS-GEN, Issue 4, test results

Part	Test description	Verdict
6.6	Occupied Bandwidth	Pass
7.1.2 ¹	Receiver radiated emission limits	Not applicable
7.1.3 ¹	Receiver conducted emission limits	Not applicable
8.8	Power Line Conducted Emissions Limits for Licence-Exempt Radio Apparatus	Pass
8.11 ²	Frequency stability	Pass

Notes: ¹According to sections 5.2 and 5.3 of RSS-Gen, Issue 4: if EUT does not have a stand-alone receiver neither scanner receiver, then it exempt from receiver requirements.

²According to section 8.11 of RSS-Gen, Issue 4: if the frequency stability of the licence-exempt radio apparatus is not specified in the applicable standard (RSS), measurement of the frequency stability is not required

2.4 IC RSS-247, Issue 1, test results

Section	Test description	Verdict
6.1 (1) ¹	Types of Modulation	Pass
6.2.1 (1)	Power limits for 5150–5250 MHz band	Not applicable
6.2.2 (1)	Power limits for 5250–5350 MHz band	Pass
6.2.3 (1)	Power limits for 5470–5600 MHz and 5650–5725 MHz bands	Not applicable
6.2.4 (1)	Power limits for 5725–5850 MHz band	Not applicable
6.2.4 (1)	Minimum 6 dB bandwidth	Not applicable
6.2.1 (2)	Unwanted emission limits for 5150–5250 MHz band	Not applicable
6.2.2 (2)	Unwanted emission limits for 5250–5350 MHz band	Pass
6.2.2 (2)	TPC requirements for devices with a maximum e.i.r.p. greater than 500 mW	Not applicable
6.2.2 (3)	e.i.r.p. at different elevations restrictions for 5250–5350 MHz band	Pass
6.2.3 (2)	Unwanted emission limits for 5470–5600 MHz and 5650–5725 MHz bands	Not applicable
6.2.4 (2)	Unwanted emission limits for 5725–5850 MHz band	Not applicable
6.3	Dynamic Frequency Selection (DFS) for devices operating in the bands 5250–5350 MHz, 5470–5600 MHz and 5650–5725 MHz	Pass

Notes: ¹ The EUT employs digital modulations, such as: 802.11a, 802.11n HT20 and 802.11n HT40

Section 3. Equipment under test (EUT) details

3.1 Sample information

Receipt date	October 4, 2016
Nemko sample ID number	133-003152 (Conducted sample) and 133-003139 (Radiated sample)

3.2 EUT information

Product name	Smart Glasses
Model	H756A (BT-300)
Model variant	N/A
Serial number	TCW27560112

3.3 Technical information

Applicant IC company number	1052D
IC UPN number	H756A
All used IC test site(s) Reg. number	2040G-5
RSS number and Issue number	RSS-247 Issue 1, Section 6, May 2015
Frequency band	5250–5350 MHz
Frequency Min (MHz)	5260(802.11a, 802.11n HT20 and 802.11ac VHT20) 5270(802.11n HT40 and 802.11ac VHT40) 5290(802.11ac VHT80)
Frequency Max (MHz)	5320(802.11a, 802.11n HT20 and 802.11ac VHT20) 5310(802.11n HT40 and 802.11ac VHT40) 5290(802.11ac VHT80)
RF power Min (W), Conducted	N/A
RF power Max (W), Conducted	0.0102 (10.1 dBm, 802.11a) 0.0100(10.0 dBm, 802.11n. HT20) 0.0096(9.1 dBm, 802.11n.HT40) 0.0100(10.0 dBm, 802.11ac.VHT20) 0.0096(9.1 dBm, 802.11ac.VHT40) 0.0092(8.3 dBm,802.11ac VHT80)
Field strength, Units @ distance	N/A
Measured BW (kHz) (99% dB)	16680(802.11a) 18070(802.11n. HT20) 36520(802.11n.HT40) 17880(802.11ac.VHT20) 36490(802.11ac.VHT40) 75870(802.11ac VHT80)
Calculated BW (kHz), as per TRC-43	N/A
Type of modulation	802.11a/n/ac
Emission classification (F1D, G1D, D1D)	W7D
Transmitter spurious, Units @ distance	44.3 dBμV/m @ 3m, Quasi-peak
Power requirements	5 VDC (Powered via external AC-DC adapter 100–240 VAC 50–60 Hz) and via battery
Antenna information	The EUT uses a non-detachable antenna to the intentional radiator. As per customer the antenna gain is 2.4 dBi at 5 GHz band

3.4 Product description and theory of operation

EUT is a smart glass with see-through lenses, which allows to overlay images on actual view. The virtual images were provided by a controller.

3.5 EUT exercise details

EUT was set to test modes during tests, by software drivers provided by customer.

3.6 EUT setup diagram

Figure 3.6-1: Setup diagram

Section 4. Engineering considerations

4.1 Modifications incorporated in the EUT

There were no modifications performed to the EUT during this assessment.

4.2 Technical judgment

EUT could be configured to different data rates. From preliminary investigation, the following was chosen to be worst case to present in this report: 6 Mbps in 802.11a, MCS0 in 802.11n and MCS0 in 802.11ac.

4.3 Deviations from laboratory tests procedures

No deviations were made from laboratory procedures.

Section 5. Test conditions

5.1 Atmospheric conditions

Temperature	15–30 °C
Relative humidity	20–75 %
Air pressure	860–1060 mbar

When it is impracticable to carry out tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests shall be recorded and stated.

5.2 Power supply range

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages $\pm 5\%$, for which the equipment was designed.

Section 6. Measurement uncertainty

6.1 Uncertainty of measurement

Measurement uncertainty budgets for the tests are detailed below. Measurement uncertainty calculations assume a coverage factor of $K = 2$ with 95% certainty.

Test name	Measurement uncertainty, dB
All antenna port measurements	0.55
Conducted spurious emissions	1.13
Radiated spurious emissions	3.78
AC power line conducted emissions	3.55

Section 7. Test equipment

Section 8. Testing data

8.1 FCC 15.403(i) Emission bandwidth

8.1.1 Definitions and limits

For purposes of this subpart the emission bandwidth shall be determined by measuring the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, that are 26 dB down relative to the maximum level of the modulated carrier. Determination of the emissions bandwidth is based on the use of measurement instrumentation employing a peak detector function with an instrument resolution bandwidth approximately equal to 1.0 percent of the emission bandwidth of the device under measurement.

8.1.2 Test summary

Test date	November 5, 2016	Temperature	25 °C
Test engineer	Yong Huang	Air pressure	1015 mbar
Verdict	Pass	Relative humidity	30 %

8.1.3 Observations, settings and special notes

Spectrum analyser settings:

Resolution bandwidth	approximately 1% of the emission bandwidth
Video bandwidth	> RBW
Detector mode	Peak
Trace mode	Max Hold

8.1.4 Test data

Table 8.1-1: 26 dB bandwidth results

Modulation	Frequency, MHz	26 dB bandwidth, MHz
802.11a	5260	21.33
	5300	21.40
	5320	21.27

Figure 8.1-3: 26 dB bandwidth on 802.11ac HT80, sample plot

8.2 RSS-Gen 6.6 Occupied bandwidth

8.2.1 Definitions and limits

The emission bandwidth (×dB) is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated × dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth in the range of 1% to 5% of the anticipated emission bandwidth, and a video bandwidth at least 3× the resolution bandwidth.

When the occupied bandwidth limit is not stated in the applicable RSS or reference measurement method, the transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured.

8.2.2 Test summary

Test date	November 5, 2016	Temperature	25 °C

8.3 FCC 15.407(a)(2) and RSS-247 6.2.2(1) 5.25–5.35 GHz band output power and spectral density limits

8.3.1 Definitions and limits

FCC:

The maximum conducted output power over the frequency bands of operation shall not exceed the lesser of 250 mW (24 dBm) or 11 dBm + 10 log₁₀ (B), where B is the 26 dB emission bandwidth in megahertz. In addition, the maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

FCC §15.407(h)(1) Transmit power control (TPC).

U-NII devices shall employ a TPC mechanism. The U-NII device is required to have the capability to operate at least 6 dB below the mean EIRP value of 30 dBm. A TPC mechanism is not required for systems with an e.i.r.p. of less than 500 mW.

IC:

The maximum conducted output power shall not exceed 250 mW (24 dBm) or 11 + 10 log₁₀(B), dBm, whichever is less, where B is the 99% emission bandwidth in megahertz. The power spectral density shall not exceed 11 dBm in any 1.0 MHz band.

The maximum e.i.r.p. shall not exceed 1.0 W (30 dBm) or 17 + 10 log₁₀ (B), dBm, whichever is less. B is the 99% emission bandwidth in megahertz. Note that devices with a maximum e.i.r.p. greater than 500 mW (27 dBm) shall implement TPC in order to have the capability to operate at least 6 dB below the maximum permitted e.i.r.p. of 1 W (30 dBm).

In addition to the above requirements, devices with a maximum e.i.r.p. greater than 200 mW (23 dBm) shall comply with the following e.i.r.p. at different elevations, where θ is the angle above the local horizontal plane (of the Earth) as shown below:

- | | | |
|------|--------------------------------------|--|
| i. | -13 dBW/MHz | for $0^\circ \leq \theta < 8^\circ$ |
| ii. | $-13 - 0.716 (\theta - 8)$ dBW/MHz | for $8^\circ \leq \theta < 40^\circ$ |
| iii. | $-35.9 - 1.22 (\theta - 40)$ dBW/MHz | for $40^\circ \leq \theta \leq 45^\circ$ |
| iv. | -42 dBW/MHz | for $\theta > 45^\circ$ |

8.3.2 Test summary

Test date	November 5, 2016	Temperature	25 °C
Test engineer	Yong Huang	Air pressure	1015 mbar
Verdict	Pass	Relative humidity	30 %

Section 8	Testing data
Test name	FCC 15.407(a)(2) and RSS-247 6.2.2(1) 5.25–5.35 GHz band output power and spectral density limits
Specification	FCC Part 15 Subpart E and RSS-247, Issue 1

8.3.3 Observations, settings and special notes

The test was performed according to 789033 D02 General UNII Test Procedures New Rules v01 section E) 2) b) Method SA-1 (trace averaging with the EUT transmitting at full power throughout each sweep).

The maximum measured 26 dB emission bandwidth for 802.11a was 21.40 MHz, for 802.11n HT20 was 21.65 MHz, for 802.11n HT40 was 40.25 MHz, for 802.11ac VHT20 was 21.73 MHz, for 802.11ac VHT40 was 40.29 MHz and for 802.11ac VHT80 was 82.20 MHz.

FCC output power limit for 802.11a was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(21.4) = 24.30 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

FCC output power limit for 802.11n HT20 was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(21.65) = 24.35 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

FCC output power limit for 802.11n HT40 was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(40.25) = 27.05 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

FCC output power limit for 802.11ac VHT20 was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(21.73) = 24.37 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

FCC output power limit for 802.11ac VHT40 was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(40.29) = 27.05 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

FCC output power limit for 802.11ac VHT80 was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(82.20) = 30.15 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

The maximum measured 99 % occupied bandwidth for 802.11a was 16.68 MHz, for 802.11n HT20 was 18.07 MHz, for 802.11n HT40 was 36.52 MHz, for 802.11ac VHT20 was 17.88 MHz, for 802.11ac VHT40 was 36.49 MHz and for 802.11ac VHT80 was 75.87 MHz.

IC output power limit for 802.11a was calculated as follows: $11 + 10 \times \log_{10}(16.68) = 23.22 \text{ dBm} < 24 \text{ dBm}$

IC output power limit for 802.11n HT20 was calculated as follows: $11 + 10 \times \log_{10}(18.07) = 23.57 \text{ dBm} < 24 \text{ dBm}$

IC output power limit for 802.11n HT40 was calculated as follows: $11 + 10 \times \log_{10}(36.52) = 26.63 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

IC output power limit for 802.11ac VHT20 was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(17.88) = 23.52 \text{ dBm} < 24 \text{ dBm}$

IC output power limit for 802.11ac VHT40 was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(36.49) = 26.62 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

IC output power limit for 802.11ac VHT80 was calculated as follows: $11 \text{ dBm} + 10 \times \log_{10}(75.87) = 29.80 \text{ dBm} > 24 \text{ dBm}$, therefore the limit is 24 dBm

IC EIRP limit for 802.11a was calculated as follows: $17 + 10 \times \log_{10}(16.68) = 29.22 \text{ dBm} < 30 \text{ dBm}$

IC EIRP limit for 802.11n HT20 was calculated as follows: $17 + 10 \times \log_{10}(18.07) = 29.57 \text{ dBm} < 30 \text{ dBm}$

IC EIRP limit for 802.11n HT40 was calculated as follows: $17 + 10 \times \log_{10}(36.52) = 32.63 \text{ dBm} > 30 \text{ dBm}$, therefore the limit is 30 dBm

IC EIRP limit for 802.11ac VHT20 was calculated as follows: $17 + 10 \times \log_{10}(17.88) = 29.52 \text{ dBm} < 30 \text{ dBm}$

IC EIRP limit for 802.11ac VHT40 was calculated as follows: $17 + 10 \times \log_{10}(36.49) = 32.62 \text{ dBm} > 30 \text{ dBm}$, therefore the limit is 30 dBm

IC EIRP limit for 802.11ac VHT80 was calculated as follows: $17 + 10 \times \log_{10}(75.87) = 35.80 \text{ dBm} > 30 \text{ dBm}$, therefore the limit is 30 dBm

TPC EIRP limit is 24 dBm

8.4 FCC 15.407(b) and RSS-247 6.2.2(2) Undesirable (unwanted) emissions

8.4.1 Definitions and limits

FCC:

- (2) For transmitters operating in the 5.25–5.35 GHz band: all emissions outside of the 5.15–5.35 GHz band shall not exceed an EIRP of –27 dBm/MHz.
- (5) The emission measurements shall be performed using a minimum resolution bandwidth of 1 MHz. A lower resolution bandwidth may be employed near the band edge, when necessary, provided the measured energy is integrated to show the total power over 1 MHz.
- (6) Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in § 15.209.
- (7) The provisions of § 15.205 apply to intentional radiators operating under this section.
- (8) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the upper and lower frequency block edges as the design of the equipment permits.

IC:

- i) For devices with both operating frequencies and channel bandwidths contained within the band 5250–5350 MHz, the device shall comply with the following:
- a) All emissions outside the band 5250–5350 MHz shall not exceed –27 dBm/MHz e.i.r.p. if the equipment is intended for outdoor use; or
 - b) All emissions outside the band 5150–5350 MHz shall not exceed –27 dBm/MHz e.i.r.p. and any emissions within the band 5150–5250 MHz shall meet the power spectral density limits of Section 6.2.1. The device shall be labelled “for indoor use only.”
- ii) For devices with operating frequencies in the band 5250–5350 MHz but having a channel bandwidth that overlaps the band 5150–5250 MHz, the devices’ unwanted emission shall not exceed –27 dBm/MHz e.i.r.p. outside the band 5150–5350 MHz and its power shall comply with the spectral power density for operation within the band 5150–5250 MHz. The device shall be labelled “for indoor use only.”

RSS-Gen 8.10 Emissions falling within restricted frequency bands

Restricted bands, identified in Table 8.4-2, are designated primarily for safety-of-life services (distress calling and certain aeronautical bands), certain satellite downlinks, radio astronomy and some government uses. Except where otherwise indicated, the following restrictions apply:

- (a) fundamental components of modulation of licence-exempt radio apparatus shall not fall within the restricted bands of below;
- (b) unwanted emissions falling into restricted bands of below shall comply with the limits specified in RSS-Gen;
- (c) unwanted emissions not falling within restricted frequency bands shall either comply with the limits specified in the applicable RSS, or with those specified in RSS-Gen.

Table 8.4-1: FCC §15.209 and RSS-Gen – Radiated emission limits

Frequency, MHz	Field strength of emissions		Measurement distance, m
	$\mu\text{V/m}$	$\text{dB}\mu\text{V/m}$	
0.009–0.490	$2400/F$ (F in kHz)	$67.6 - 20 \times \log_{10}(F)$ (F in kHz)	300
0.490–1.705	$24000/F$ (F in kHz)	$87.6 - 20 \times \log_{10}(F)$ (F in kHz)	30
1.705–30.0	30	29.5	30
30–88	100	40.0	3
88–216	150	43.5	3
216–960	200	46.0	3
above 960	500	54.0	3

Notes: In the emission table above, the tighter limit applies at the band edges.

For frequencies above 1 GHz the limit on peak RF emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test

8.4.2 Test summary

Test date:	November 9, 2016 to November 13, 2016	Temperature:	24 °C
Test engineer:	Yong Huang	Air pressure:	1010 mbar
Verdict:	Pass	Relative humidity:	40 %

8.4.3 Observations, settings and special notes

The spectrum was searched from 30 MHz to 40 GHz.

EUT was set to transmit with 100 % duty cycle.

Radiated measurements were performed at a distance of 3 m. Radiated emissions were performed while antenna connector was terminated with 50 Ω load.

Spectrum analyser for peak conducted measurements within restricted bands below 1 GHz:

Resolution bandwidth:	100 kHz
Video bandwidth:	300 kHz
Detector mode:	Peak
Trace mode:	Max Hold

Average limit line was set as follows: 54 dB μ V/m – 95.23 dB – 4.7 dB = -45.93 dBm

Antenna gain is included in the offset of the measurement.

Spectrum analyser for peak conducted measurements within restricted bands above 1 GHz:

Resolution bandwidth:	1 MHz
Video bandwidth:	3 MHz
Detector mode:	Peak
Trace mode:	Max Hold

Average limit line was set as follows: 54 dB μ V/m – 95.23 dB = -41.23 dBm/MHz

Antenna gain is included in the offset of the measurement.

Spectrum analyser for average conducted measurements within restricted bands above 1 GHz for frequencies where peak results were above the average limit:

Resolution bandwidth:	1 MHz
Video bandwidth:	10 MHz
Detector mode:	RMS
Trace mode:	Power average
Number of averaging traces:	100

Peak limit is 20 dB higher than the average limit: -41.23 dBm/MHz + 20 dB = -41.23 dBm/MHz

Antenna gain is included in the offset of the measurement.

Spectrum analyser for peak conducted measurements outside restricted bands:

Resolution bandwidth:	1 MHz
Video bandwidth:	3 MHz
Detector mode:	Peak
Trace mode:	Max Hold

8.5 FCC 15.207(a) and RSS-Gen 8.8 AC power line conducted emissions limits

8.5.1 Definitions and limits

FCC §15.407(6)(b):

Any U-NII devices using an AC power line are required to comply also with the conducted limits set forth in §15.207

FCC §15.207(a):

Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 Ω line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

IC:

A radio apparatus that is designed to be connected to the public utility (AC) power line shall ensure that the radio frequency voltage, which is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz, shall not exceed the limits in table below.

Unless the requirements applicable to a given device state otherwise, for any radio apparatus equipped to operate from the public utility AC power supply either directly or indirectly (such as with a battery charger), the radio frequency voltage of emissions conducted back onto the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in table below. The more stringent limit applies at the frequency range boundaries.

Table 8.5-1: Conducted emissions limit

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average**
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

Note: * - The level decreases linearly with the logarithm of the frequency.

** - A linear average detector is required.

8.5.2 Test summary

Test date	October 6, 2016	Temperature	25 °C
Test engineer	Yong Huang	Air pressure	1009 mbar
Verdict	Pass	Relative humidity	40 %

8.5.3 Observations, settings and special notes

The EUT was set up as tabletop configuration.

The spectral scan has been corrected with transducer factors (i.e. cable loss, LISN factors, and attenuators) for determination of compliance.

A preview measurement was generated with the receiver in continuous scan mode. Emissions detected within 6 dB or above limit were re-measured with the appropriate detector against the correlating limit and recorded as the final measurement.

Receiver settings for preview measurements:

Resolution bandwidth	9 kHz
Video bandwidth	30 kHz
Detector mode	Peak and Average
Trace mode	Max Hold
Measurement time	100 ms

Receiver settings for final measurements:

Resolution bandwidth	9 kHz
Video bandwidth	30 kHz
Detector mode	Quasi-Peak and Average
Trace mode	Max Hold
Measurement time	100 ms

8.5.1 Test data

Plot 8.5-1: Conducted emissions on phase line

Table 8.5-2: Quasi-Peak results AC power line conducted emissions limits – phase line

Frequency (MHz)	Quasi-Peak result ^{1 and 3} (dBµV)	Quasi-Peak limit (dBµV)	Margin (dB)	Measurement time (ms)	Bandwidth (kHz)	Conductor	Filter	Correction factor ² (dB)
0.181500	50.1	64.4	14.3	100.0	9	L1	ON	10.2
0.188250	48.8	64.1	15.4	100.0	9	L1	ON	10.2

Notes: ¹ Result (dBµV) = receiver/spectrum analyzer value (dBµV) + correction factor (dB)

² Correction factor (dB) = LISN factor IL (dB) + cable loss (dB) + attenuator (dB)

³ The maximum measured value observed over a period of 15 seconds was recorded.

Sample calculation: 53.4 dBµV (result) = 43.3 dBµV (receiver reading) + 9.9 dB (Correction factor)

Plot 8.5-2: Conducted emissions on neutral line

Table 8.5-3: Quasi-Peak results AC power line conducted emissions limits – neutral line

Frequency (MHz)	Quasi-Peak result ¹ and ³ (dBµV)	Quasi-Peak limit (dBµV)	Margin (dB)	Measurement time (ms)	Bandwidth (kHz)	Conductor	Filter	Correction factor ² (dB)
0.174750	50.4	64.7	14.3	100.0	9	N	ON	10.2
0.444750	43.9	57.0	13.1	100.0	9	N	ON	10.0

Notes:

¹ Result (dBµV) = receiver/spectrum analyzer value (dBµV) + correction factor (dB)

² Correction factor (dB) = LISN factor IL (dB) + cable loss (dB) + attenuator (dB)

³ The maximum measured value observed over a period of 15 seconds was recorded.

Sample calculation: 53.4 dBµV (result) = 43.3 dBµV (receiver reading) + 9.9 dB (Correction factor)

8.6 FCC 15.407(g) and RSS-Gen 8.11 Frequency stability

8.6.1 Definitions and limits

Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user's manual.

8.6.2 Test summary

Test date:	November 10, 2016	Temperature:	24 °C
Test engineer:	Yong Huang	Air pressure:	1009 mbar
Verdict:	Pass	Relative humidity:	37 %

8.6.3 Observations, settings and special notes

Spectrum analyser settings:

Resolution bandwidth:	10 Hz
Video bandwidth:	10 Hz
Detector mode:	Peak
Trace mode:	Max Hold

8.6.4 Test data

Table 8.6-1: Frequency drift measurement

Test conditions	Frequency, GHz	Drift, Hz
+35 °C, Nominal	5.31996755	-5420
+30 °C, Nominal	5.31997216	-809
+20 °C, +15 %	5.31997297	0
+20 °C, Nominal	5.31997297	Reference
+20 °C, -15 %	5.31997297	0
+10 °C, Nominal	5.31998881	15835
+5 °C, Nominal	5.32005716	84190

Note: Frequency stability was assessed between two +5 °C and +35 °C, as per client's manual.
Maximum recorded frequency drift was 84 kHz, which is 16 ppm

8.7 FCC 15.407(h)(2) Radar Detection Function of Dynamic Frequency Selection (DFS)

8.7.1 Definitions and limits

(2) Radar Detection Function of Dynamic Frequency Selection (DFS). U-NII devices operating with any part of its 26 dB emission bandwidth in the 5.25–5.35 GHz and 5.47–5.725 GHz bands shall employ a DFS radar detection mechanism to detect the presence of radar systems and to avoid co-channel operation with radar systems. Operators shall only use equipment with a DFS mechanism that is turned on when operating in these bands. The device must sense for radar signals at 100 percent of its emission bandwidth. The minimum DFS detection threshold for devices with a maximum e.i.r.p. of 200 mW to 1 W (23–30 dBm) is –64 dBm. For devices that operate with less than 200 mW (23 dBm) e.i.r.p. and a power spectral density of less than 10 dBm in a 1 MHz band, the minimum detection threshold is –62 dBm. The detection threshold is the received power averaged over 1 microsecond referenced to a 0 dBi antenna. For the initial channel setting, the manufacturers shall be permitted to provide for either random channel selection or manual channel selection.

(i) Operational Modes. The DFS requirement applies to the following operational modes:

(A) The requirement for channel availability check time applies in the master operational mode.

(B) The requirement for channel move time applies in both the master and slave operational modes.

(ii) Channel Availability Check Time. A U-NII device shall check if there is a radar system already operating on the channel before it can initiate a transmission on a channel and when it has to move to a new channel. The U-NII device may start using the channel if no radar signal with a power level greater than the interference threshold values listed in paragraph (h)(2) of this section, is detected within 60 seconds.

(iii) Channel Move Time. After a radar's presence is detected, all transmissions shall cease on the operating channel within 10 seconds. Transmissions during this period shall consist of normal traffic for a maximum of 200 ms after detection of the radar signal. In addition, intermittent management and control signals can be sent during the remaining time to facilitate vacating the operating channel.

(iv) Non-occupancy Period. A channel that has been flagged as containing a radar system, either by a channel availability check or in-service monitoring, is subject to a non-occupancy period of at least 30 minutes. The non-occupancy period starts at the time when the radar system is detected.

Table 8.7-1: DFS Response Requirement Values

Parameter	Value
Non-occupancy period	Minimum 30 minutes
Channel Availability Check Time	60 seconds
Channel Move Time	10 seconds ¹
Channel Closing Transmission Time	200 milliseconds + an aggregate of 60 milliseconds over remaining 10 second period ^{1 and 2}
U-NII Detection Bandwidth	Minimum 80% of the 99% power bandwidth ³

Notes: ¹ The instant that the *Channel Move Time* and the *Channel Closing Transmission Time* begins is as follows:

- For the Short pulse radar Test Signals this instant is the end of the Burst.
- For the Frequency Hopping radar Test Signal, this instant is the end of the last radar burst generated.
- For the Long Pulse radar Test Signal this instant is the end of the 12 second period defining the radar transmission.

² The *Channel Closing Transmission Time* is comprised of 200 milliseconds starting at the beginning of the *Channel Move Time* plus any additional intermittent control signals required to facilitate Channel changes (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.

³ During the *U-NII Detection Bandwidth* detection test, radar type 1 is used and for each frequency step the minimum percentage of detection is 90%. Measurements are performed with no data traffic.

Table 8.7-2: Short Pulse Radar Test Waveforms

Radar type	Pulse width, μs	Pulse Repetition Interval (PRI), μs	Number of pulses	Minimum percentage of successful detection	Minimum number of trials
0	1	1428	18	See note	See note
1	1	Test A: 15 unique PRI values randomly selected from the list of 23 PRI values in table below Test B: 15 unique PRI values randomly selected within the range of 518–3066 μs, with a minimum increment of 1 μs, excluding PRI values selected in Test A	$\text{Roundup}\{(1 \div 360) \times (19 \times 10^6 \div \text{PRI}_{\mu\text{s}})\}$	60%	30
2	1–5	150–230	23–29	60%	30
3	6–10	200–500	16–18	60%	30
4	11–20	200–500	12–16	60%	30
Aggregate (Radar types 1–4)				80%	120

Note: Short Pulse Radar Type 0 should be used for the detection bandwidth test, channel move time, and channel closing time tests.

Table 8.7-3: Pulse Repetition Intervals Values for Test A

Pulse Repetition Frequency number	Pulse Repetition Frequency, Pulses per second	Pulse Repetition Interval (PRI), μs
1	1930.5	518
2	1818.7	538
3	1792.1	558
4	1730.1	578
5	1672.2	598

17	1193.3	838
18	1165.6	858
19	1139.0	878
20	1113.6	898
21	1089.3	918
22	1066.1	938
23	326.2	3066

Table 8.7-4: Long Pulse Radar Test Waveforms

Radar type	Pulse width, μs	Chirp width, MHz	Pulse Repetition Interval (PRI), μs	Number of pulses per burst	Number of bursts	Minimum percentage of successful detection	Minimum number of trials
5	50–100	5–20	1000–2000	1–3	8–20	80%	30

Table 8.7-5: Frequency Hopping Radar Test Waveforms

Radar type	Pulse width, μs	Pulse Repetition Interval (PRI), μs	Pulses per hop	Hopping rate, kHz	Hopping sequence length, ms	Minimum percentage of successful detection	Minimum number of trials
6	1	333	9	0.333	300	70%	30

8.7.2 Test summary

Test date:	November 25, 2016	Temperature:	24 °C
Test engineer:	Yong Huang	Air pressure:	1009 mbar
Verdict:	Pass	Relative humidity:	37 %

8.7.3 Observations, settings and special notes

Since EUT is a client device without DFS radar detection mechanism, therefore only two tests are applicable: Channel Move Time and Channel Closing Transmission Time. Transmit channel was set at 5300 MHz(for channel move time test) and 5280 MHz for (Non-occupancy time test). The Radar type 0 was supplied to a Master device antenna port. The testing was performed with an approved master (provided by customer) operating in 40 MHz BW mode.
