

5 TEST RESULTS FOR 802.11A

5.1 CONDUCTED EMISSIONS MEASUREMENT – FCC §15.207; RSS-210 §9

5.1.1 LIMITS OF CONDUCTED EMISSIONS MEASUREMENT

Frequency of Emission (MHz)	Conducted Limit (dBuV)	
	Quasi-peak	Average
0.15-0.5	66-56	56-46
0.5-5.0	56	46
5.0-30.0	60	50

5.1.2 CONDUCTED EMISSIONS MEASUREMENT TEST PROCEDURE

The EUT was placed 0.4 meters from the conducting bulkhead of the shielded room. The EUT was connected to mains through a line impedance stabilization network (LISN). The LISN provides 50 ohm/50 uH coupling impedance to the measuring receiver.

The test frequency range was from 150 kHz to 30 MHz.

5.2 RADIATED EMISSIONS MEASUREMENT - §15.209; RSS-210 §6.2.1

5.2.1 LIMITS OF RADIATED EMISSIONS MEASUREMENT

Frequency (MHz)	Field Strength (uV/m)	Measurement Distance (m)
0.009-0.490	2400/F (kHz)	300
0.490-1.705	2400/F (kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

As shown in 15.35(b), for frequencies above 1000 MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20 dB under any circumstances of modulation.

5.2.2 RADIATED EMISSIONS MEASUREMENT TEST PROCEDURE

Before final measurements of radiated emissions were made on the open-field three/ten meter range, the EUT was scanned indoors at one and three meter distances. This was done in order to determine its emissions spectrum signature. The physical arrangement of the test system and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction, and frequency. This process was repeated during final radiated emissions measurements on the open-field range, at each frequency, in order to ensure that maximum emission amplitudes were attained.

Final radiated emissions measurements were made on the three/ten-meter, open-field test site. The EUT was placed on a nonconductive turntable 0.8 meters above the ground plane. The spectrum was examined from 30 MHz to 2,000 MHz.

At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations. For frequencies between 30 and 1000 MHz, the spectrum analyzer's 6 dB bandwidth was set to 120 kHz, and the analyzer was operated in the CISPR quasi-peak detection mode. For emissions above 1000 MHz, emissions are measured using the average detector function with a minimum resolution bandwidth of 1 MHz. No video filter less than 10 times the resolution bandwidth was used. The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.

TABLE 5-2: RADIATED EMISSIONS TEST EQUIPMENT

RTL ASSET #	MANUFACTURER	MODEL	PART TYPE	SERIAL NUMBER	CALIBRATION DUE DATE
900772	EMCO	3161-02	Horn Antenna (2 - 4 GHz)	9804-1044	5/20/07

6 TEST RESULTS FOR 802.11A – 5150 – 5350 MHZ

6.1 PEAK TRANSMIT POWER MEASUREMENT – FCC §15.407(A/1/2/3); RSS-210 §6.6.2(Q1)

6.1.1 LIMITS OF PEAK TRANSMIT POWER MEASUREMENT

Frequency Band	Limit
5.15-5.25GHz	The lesser of 50 mW (17 dBm) or 4 dBm+10logB
5.25-5.35GHz	The lesser of 250 mW (24 dBm) or 11 dBm+10logB
5.725-5.825GHz	The lesser of 1 W (30 dBm) or 17 dBm+10logB

6.1.2 PEAK TRANSMIT POWER MEASUREMENT TEST PROCEDURE

The EUT was connected to a power meter.

TABLE 6-1: PEAK TRANSMIT POWER MEASUREMENT TEST EQUIPMENT

RTL ASSET #	MANUFACTURER	MODEL	PART TYPE	SERIAL NUMBER	CALIBRATION DUE DATE

6.2 PEAK POWER EXCURSION MEASUREMENT – FCC §15.407(A)(6)

6.2.1 LIMITS OF PEAK POWER EXCURSION

Frequency Band	Limit
5.15-5.25 GHz	13 dB
5.25-5.35 GHz	13 dB
5.725-5.825 GHz	13 dB

6.2.2 PEAK POWER EXCURSION MEASUREMENT TEST PROCEDURE

1. The transmit output was connected to a spectrum analyzer.
2. Span was set to the entire emission bandwidth of signal.
3. Using peak detector and max hold function for trace A, set RBW to 1 MHz and VBW to 3,MHz. Set for trace B, RBW to 1 MHz and VBW to 300 kHz.
4. Record the largest difference between trace A and trace B in any 1 MHz band on any frequency.

TABLE 6-3: PEAK POWER EXCURSION MEASUREMENT TEST EQUIPMENT

6.4 FREQUENCY STABILITY MEASUREMENT – FCC §15.407(G)

6.4.1 LIMITS OF FREQUENCY STABILITY

The frequency tolerance of the CW shall be maintained within +/-0.02% of the operating frequency over a temperature variation of -30° C to 50° C at normal supply voltage, and for a variation in the primary supply voltage from 85%-115% of the rated supply voltage at a temperature of 20° C.

6.4.2 FREQUENCY STABILITY MEASUREMENT TEST PROCEDURE

1. The EUT was placed inside temperature chamber and supplied by nominal DC power.
2. The EUT was connected to spectrum analyzer which was located outside of test chamber.
3. The temperature was set to the high limit and the EUT was allowed to stabilize with power off for a period of 30 minutes.
4. The EUT was then powered up and the frequency of the CW was measured at intervals of 2, 5, and 10 minutes.
5. Steps 3 and 4 were repeated at the lower temperature limit of 20 degrees C.
6. The chamber was then allowed to stabilize at a temperature of 20 degrees C for approximately 30 minutes. The EUT supply voltage was then adjusted to 85% and 115% of nominal and the CW frequency was again recorded.
