Issue Date: January 21, 2005

Customer: Nivis, LLC

Model: Amplified Radio Modem RF-P9-05-01-03

GENERAL INFORMATION

1.1 Product Description

The Equipment Under Test (EUT) is the Nivis Amplified Radio Modem RF-P9-05-01-03. The EUT is a Spread-Spectrum Frequency Hopping RF Modem operating in the 902-928 MHz ISM band. The radio modem is designed for remote data acquisition systems.

The RF-P9-05-01-03 radio modem exhibits the following features:

- Low power consumption achievable by employing the ultra-low power MSP430F149 microprocessor which powers the RF section down through a digital output pin of the processor. Power-down current draw as low as 5 μ A is achievable.
- RF output of 23 dB achievable by employing the MAX2235 power amplifier
- Exceptional -117 dB sensitivity achieved with an external LNA used in conjunction with Chipcon's CC1020 RF transceiver
- No additional processing entities are required for data acquisition since the modem can read digital and analog data from the surrounding world through 8 digital I/O lines and 2 analog lines
- Communication with external processing entities is achieved serially either through a dedicated selectable baud-rate hardware UART at CMOS level or through a bit-banged I2C bus
- Operates over the extended temperature range of -40° to +85° and 80% non-condensing humidity
- Built in software protocol for error control and re-transmissions
- Frequency hopping algorithm which employs 50 frequency channels equally distributed over the 902-928 MHz band
- Compact size of 2" x 1.5" x 0.3" and weight of 0.8 oz (23 grams).
- Over-the-air re-programming of the firmware possible since an on-board 64 kByte EEPROM provides enough storage capability for code hot-swapping
- Integrated AFC (Automatic Frequency Correction) hardware and accompanying software algorithm excludes the need for a precise crystal operating over the extended temperature range
- Connectivity is provided through two 12-pin .100 single row headers
- Two shields (one over the digital section and one over the RF section) greatly reduce radiated RF interfering emissions and improve RF immunity

1.2 Related Submittal(s)/Grant(s)

The EUT will be used to send/receive data. The transceiver presented in this report will be used with other like transceivers:

The EUT is subject to the following authorizations:

- a) Certification as a transceiver (modular approval)
- b) Verification as a digital device

The information contained in this report is Page 5
authorization(s) for the EUT. The

presented for the certification & verification
manufacturer desires to seek a modular

TESTS AND MEASUREMENTS

Report Number: 04-0282

Issue Date: January 21, 2005

Customer: Nivis, LLC

Model: Amplified Radio Modem RF-P9-05-01-03

TEST AND MEASUREMENTS

2.1 Configuration of Tested System

The sample was tested per ANSI C63.4, Methods of Measurement from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz (1992). Conducted and radiated emissions data were taken with the test receiver or spectrum analyzer's resolution bandwidth adjusted to 9 kHz and 120 kHz, respectively. All measurements are peak unless stated otherwise. The video filter associated with the spectrum analyzer was off throughout the evaluation process. Interconnecting cables were manipulated as necessary to maximize emissions. Block diagrams of the tested systems are shown in Figures 1a and 16. Test configuration photographs for spurious and fundamental emissions are shown in Figure 2a -g.

The sample used for testing was received by U.S. Technologies on December 4, 2004 in good condition.

2.2 Test Facility

Testing was performed at US Tech's measurement facility at 3505 Francis Circle, Alpharetta, GA. This site has been fully described and submitted to the FCC, and accepted in their letter marked 31040/SIT. Additionally this site has also been fully described and submitted to Industry Canada (IC), and has been approved under file number IC2982.

2.3 Test Equipment

Table 2 describes test equipment used to evaluate this product.

2.4 Modifications

No modifications were made by US Tech, to bring the EUT into compliance with FCC Part 15, Class B Limits for the transmitter portion of the EUT or the Class B Digital Device Requirements.

2.6 Antenna Description (Paragraph 15.203)

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The Nivis modem uses both a permanently attached antenna for the Fractal Antenna and a reverse SMA connector for the Dual Band Antenna.

1. Fractal Nivis-Falcon Antenna

Type of antenna Fractal antenna which consists of a straight radiator fed in the center. Radiator is etched out of copper on a PCB in the shape determined by fractal algorithms to be optimal for the desired band. Antenna is tuned to be resonant at 1.05 Ghz since the final enclosure load lowers the resonant frequency to 915 Mhz.

Model number: NIVIS-FALCON

US PAT #6452553 & Patent Pending

Manufacturer: Fractal Antenna Systems Inc.

Antenna gain:	Frequency	Dipole	Fractal (dBd)
(Gain measurements obtained by	902 Mhz	0 dBd	1.73 dBd
comparing to gain of a dipole antenna)	915 Mhz	0 dBd	-1.3 dBd
	928 Mhz	0dBd	0

Type of connector: Antenna is soldered directly to the antenna pad J3.
Antennal pad is a SMA connector footprint in order to allow the possibility to mount an SMA connector for conducted RF output tests.

2. Comtelco Dual Band Mobile Antenna

Type of antenna: Dual band cellular PCS mobile antenna, ultra-wide band performance covering 806 – 928 and 1710-1970 Mhz.

Model number: A113182B

Part number: 438155

Manufacturer: Comtelco Industries

Antenna gain: Unity gain.

Type of connector: SMA connector

2.7 Peak power within the band 902 – 928 MHz per FCC Section 15.247(b)

Peak power within the band 902 – 928 MHz has been measured with a spectrum analyzer by connecting the spectrum analyzer directly via a short cable to the antenna output terminals or across the antenna leads on the PCB as specified by the manufacturer. The spectrum analyzer was set for a 50 Ω impedance with the VBW $\geq$ RBW 6 dB bandwidth. The results of the measurements are given in Table 3 and Figure 3a1 through Figure 3b3.

Fundamental Frequencies were measured at Low Channel, Mid Channel, High Channel.

2.8 Antenna Conducted Spurious Emission the Frequency Range 30 – 25000 MHz (FCC Section 15.247(c))

Spurious emissions in the frequency range 30 – 25000 MHz have been measured with a spectrum analyzer by connecting the spectrum analyzer directly via a short cable to the antenna output terminals or across the antenna leads on the PCB as specified by the manufacturer. The spectrum analyzer was set for a 50 Ω impedance with the RBW = 100 kHz & VBW > RBW. All spurious emissions were measured to be greater than 20 dB down from the fundamental. The results of conducted spurious emissions are given in Figure 4a through 4l.
