Note :

1. The input to the amplifier is CDMA, NADC, GSM modulated signal tuned such that the output power is set to its maximum rated output power.
2. The RF output ports were properly terminated by the RF load and were connected to the RF Power Meter and Spectrum analyzer through the directional coupler.
3. The spectrum analyzer for this measurement was set with the RBW 100kHz in the range of 30MHz ~1GHz, and RBW 1MHz in the range of 1GHz~26.5GHz, as recorded in the plots. The VBW was set the same as RBW.
4. The measurements were performed at the shielded room with environmental conditions of 23.9 °C, 55%RH
5. Plots were taken with single input at low, mid, and high of the band. Plots were taken of the out-of-band emissions from 30MHz to the 10th harmonic of the carrier frequency.
6. For measuring emissions above 0.9 GHz, a high-pass filter was used to eliminate the fundamental transmit frequency to prevent possible saturation effects on the front end of the spectrum analyzer.
7. The emissions shall not be more than $43 + 10 \log (P)$ dBc below the mean power output, which is equivalent to -13 dBm.
