## **1. INSTROCTION**

---

### **1.1 General**

This EUT (Equipment Under Test) has been shown to be capable of compliance with the applicable technical standards and tested in accordance with the measurement procedures as indicated in this report ESTECH Lab attests to accuracy of test data. All measurement reported herein were performed by ESTECH Co., Ltd.

ESTECH Lab., assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

### **1.2 Test Lab.**

**Corporation Name:** ESTECH Co. Ltd.

**Head Office:** Rm. 1015, World Venture Center II, 426-5, Gansan-dong, Geumcheon-gu, Seoul,

## **2. Description of EUT**

---

### **2.1 Summary of Equipment Under Test**

- ◆ **FCC ID :** STENRPCS20A
- ◆ **Model No. :** RTNR 1900CA-20S
- ◆ **Freq. Range :**
  - Downlink: 1930 ~ 1945MHz
  - Uplink: 1850 ~ 1865MHz
- ◆ **Power Rating :** AC110V, 50/60Hz
- ◆ **EUT Type :** RF Repeater(CDMA), 1900MHz PCS Block A

### **3. DESCRIPTION OF TEST**

---

#### **3.1 RF Power Output**

- The EUT is a bi-directional amplifier repeater on A-band frequency for broadband PCS. Downlink input (from Base station direction) is connected to a signal generator. Downlink output is connected spectrum analyzer through proper attenuator. The input to the amplifier is set such that the maximum power output is achieved at customer supplied antenna connector. The power measurement method of Uplink is also same way.

#### **3.5 Occupied Bandwidth**

The signal (Down/Up) input is connected to the signal generator. The input to the amplifier is set such that the maximum power output is achieved at the customer supplied antenna connector (at the antenna connector of base station). Maximum Allowable Downlink Power Output is 40dBm and Maximum Allowable Uplink Power Output is 25dBm. The signal output is connected to the spectrum analyzer. The VBW is set to 3 times the RBW. The sweep time is coupled.

#### **3.6 Spurious and Harmonic Emission at Antenna Terminal**

The various conducted spurious and harmonic frequencies is measured by means of a calibrated spectrum analyzer. The spectrum is scanned from the lowest frequency generated in the equipment up to 20GHz.

Set the RES BW to 1% of the emission bandwidth to show compliance with the -13dBm, limit, in the 1MHz bands immediately outside and adjacent to the top and bottom edges of the frequency block.

For the Out-of-Band measurements a 1MHz RBW was used to scan from 30MHz to 10xfo of the fundamental carrier for all frequency block. A display line was placed at -13dBm to show compliance for spurious, and harmonics.

Inter-modulation Attenuation Test (2 Signal Method) Blocks Tested: A-B Downlink/Uplink Modulation Tested: Three input signals are chosen such that in the 15MHz channel blocks the lowest and second lowest channels are selected, and highest and second highest channels.

#### **3.7 Radiation Spurious and Harmonic Emissions**

Radiation and harmonic emission are measured outdoors at our 3 meters test range. The equipment under test is placed on a wooden turntable 3 meters from the receive antenna. The receive antenna height and turntable rotations were adjusted for the highest reading on the receive spectrum analyzer. A half wave dipole was substituted in place of the EUT. This dipole antenna was driven by a signal generator with the level of the signal generator being adjusted to obtain the same receive spectrum analyzer reading. This level is recorded. For readings above 1GHz, the above procedure is repeated using horn antennas and the difference between the gain of the horn and an isotropic or dipole antenna are taken into consideration.

### **3. DESCRIPTION OF TEST(CONTINUE)**

---

#### **3.8 Frequency stability (Temperature Variation)**

The frequency stability of the transmitter is measured by:

- a) Temperature:** The temperature is varied from -30°C to +50°C using an environmental chamber.
- b) Primary Supply Voltage:** The primary supply voltage is varied from 85% to 115% of the voltage normally at the input to the device or at the power supply terminals if cables are not normally supplied.

※ The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

#### **Time Period and Procedure**

1. The carrier frequency of the transmitter and the individual oscillators is measured at room temperature (22°C to 25°C to provide a reference.)
2. The equipment is subjected to an overnight “soak” at -30°C without any power applied.
3. After the overnight “soak” at -30°C (usually 14 – 16hours), the equipment is turned on in a “standby” condition for one minute before applying power to the transmitter. Measurement of the carrier frequency of the transmitter and the individual oscillators is made within a three minute interval after applying power to the transmitter.
4. Frequency measurements are made at 10°C interval up to room temperature. At least a period of one and one half hour is provided to allow stabilization of the equipment at each temperature level.
5. Again the transmitter carrier frequency and the individual oscillators is measured at room temperature to begin measurement of the upper temperature levels.
6. Frequency measurements are at 10 intervals starting -30°C up to +50°C allowing at least two hours at each temperature for stabilization. In all measurements the frequency is measured within three minutes after re-applying power to the transmitter.
7. The artificial load is mounted external to the temperature chamber.
