

FCC ID: SVF-KP20
IC: SVF-KP20
Model: PC-KP20

Prediction of MPE limit at given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = PG / 4\pi R^2$$

where: S = Power density
P = Power input to the antenna
G = Antenna gain
R = Distance to the center of radiation of the antenna

The table below is excerpted from Table 1B of 47 CFR 1.1310 titled "Limits for Maximum Permissible Exposure (MPE), Limits for General Population/Uncontrolled Exposure"

Frequency Range (MHz)	Power Density (mW/cm ²)	Averaging Time (minutes)
300 -1500	f/1500	30
1500 - 100000	1.0	30

where f = Frequency (MHz)

Prediction:

P Max power input to the antenna: 20.2 dBm / 105.0 mW
R Distance: 20 cm
S MPE limit for uncontrolled exposure: 1 mW/cm²

G_i Antenna gain (internal antenna): 1.48 numerical
G_e Antenna gain (external antenna): 1.41 numerical

Calculated Power density with internal antenna: 0.03 mW/cm²
Calculated Power density with external antenna: 0.04 mW/cm²

This prediction demonstrates the following:

The power density levels at a distance of 20 cm are below the maximum levels allowed by regulations.
