

RF TEST REPORT

Report No.: RF_SL16022201-UBN-001_FCC IC Rev 1.0
Supersede Report No.: RF_SL16022201-UBN-001_FCC IC

Applicant	Ubiquiti Network, Inc.
Product Name	Point to Point Device
Model No.	AF4X
Test Standard	47 CFR Part 90 Subpart Y RSS-111, Sep, 2014, Issue 5
Test Procedure	47 CFR Part 90 Subpart Y RSS-Gen, Nov 2014, Issue 4
FCC ID	SWX-AF4X
IC ID	6545A-AF4X
Date of test	03/07/2016 - 03/16/2016
Issue Date	04/04/2016
Test Result	<u>Pass</u> Fail
Equipment complied with the specification	[x]
Equipment did not comply with the specification	[]

Laboratory Introduction

SIEMIC, headquartered in the heart of Silicon Valley, with superior facilities in US and Asia, is one of the leading independent testing and certification facilities providing customers with one-stop shop services for Compliance Testing and Global Certifications.

In addition to testing and certification, SIEMIC provides initial design reviews and compliance management throughout a project. Our extensive experience with China, Asia Pacific, North America, European, and International compliance requirements, assures the fastest, most cost effective way to attain regulatory compliance for the global markets.

Accreditations for Conformity Assessment

Country/Region	Accreditation Body	Scope
USA	FCC, A2LA	EMC, RF/Wireless, Telecom
Canada	IC, A2LA, NIST	EMC, RF/Wireless, Telecom
Taiwan	BSMI, NCC, NIST	EMC, RF, Telecom, Safety

2 Executive Summary

The purpose of this test program was to demonstrate compliance of following product

Company: Ubiquiti Network, Inc.
Product: Point to Point Device
Model: AF4X

against the current Stipulated Standards. The specified model product stated above has demonstrated compliance with the Stipulated Standard listed on 1st page.

3 Customer information

Applicant Name	Ubiquiti Networks, Inc.
Applicant Address	2580 Orchard Parkway, San Jose, CA 95131
Manufacturer Name	Ubiquiti Networks, Inc.
Manufacturer Address	2580 Orchard Parkway, San Jose, CA 95131

4 Test site information

Lab performing tests	SIEMIC Laboratories

6 EUT Information

6.1 EUT Description

Product Name	Point to Point Device
Model No.	AF4X
Trade Name	Ubiquiti
Serial No.	1605PO418D6E3B950
Input Power via PoE	24VDC
PoE Adapter Manu/Model	GP-H240-100G-4
Power Adapter SN	N/A-0000414
Hardware version	N/A
Software version	5.0
Date of EUT received	03/07/2016
Equipment Class/ Category	TNB
Highest Clock Frequency	N/A
Port/Connectors	RJ45

6.2 Radio Description

Spec for Radio -

Radio Type	
Operating Frequency	4940MHz – 4990MHz
Modulation	OFDM, 16-QAM, 64-QAM, 256-QAM
Channel Bandwidth	5MHz, 10MHz, 20MHz
Antenna Gain	26dBi
Antenna Type	External antenna
Antenna Connector Type	SMA-type

6.3 EUT test modes/configuration Description

Test Mode		Note
Test_mode_1	Continuous Transmit	-
Test_mode_2	-	-
Remark:		

Note: Different data rate have been verified, the results shows the worst case only.

7 Supporting Equipment/Software and cabling Description

7.1 Supporting Equipment

Item	Supporting Equipment Description	Model	Serial Number	Manufacturer	Note
1	Laptop	T530	-	Lenovo	-
2	PoE Adapter	GP-H240-100G-4	-	Ubiquiti	-

7.2 Test Software Description

Test Item	Software	Description
RF Tests	Telnet	Set the EUT to different channels and modulations

8 Test Summary

Test Item	Test standard		Test Method/Procedure	Pass / Fail
Occupied Bandwidth & Emissions Mask	FCC IC	§90 Subpart Y RSS-111	FCC §2.1049 FCC §90.210 RSS-Gen	☒ Pass ☐ N/A

Frequency Stability	FCC IC	§90 Subpart Y RSS-111	FCC §2.1055 FCC §90.213 RSS-Gen	☒ Pass ☐ N/A
Remark	- All measurement uncertainties do not take into consideration for all presented test results. - The applicant shall ensure frequency stability by showing that an emission is maintained within the band of operation under all normal operating conditions as specified in the user's manual.			

9 Measurement Uncertainty

Emissions			
Test Item	Frequency Range	Description	Uncertainty
Radiated Spurious Emissions	30MHz – 1GHz	Confidence level of approximately 95% (in the case where distributions are normal), with a coverage factor of 2 (for EUTs < 0.5m X 0.5m X 0.5m)	+5.6dB/-4.5dB
Radiated Spurious Emissions	1GHz – 40GHz	Confidence level of approximately 95% (in the case where distributions are normal), with a coverage factor of 2 (for EUTs < 0.5m X 0.5m X 0.5m)	+4.3dB/-4.1dB

10 Measurements, Examination and Derived Results

10.1 Occupied Bandwidth & Emissions Mask

Requirement(s):

Spec	Requirement	Applicable																							
FCC §2.1049 FCC §90.210 RSS-111	For low power transmitters (20 dBm or less) and high power transmitters (greater than 20 dBm operating in the 4940-4990 MHz frequency band, the power spectral density of the emissions must be attenuated below the output power of the transmitter as follows: <table border="1"> <thead> <tr> <th rowspan="2">Frequency Offset f_d</th><th colspan="2">Minimum Attenuation</th></tr> <tr> <th>Low Power Transmitter</th><th>High Power Transmitter</th></tr> </thead> <tbody> <tr> <td>$0 < f_d \leq 45$</td><td>0</td><td>0</td></tr> <tr> <td>$45 < f_d \leq 50$</td><td>$219 \log(f_d/45)$</td><td>$568 \log(f_d/45)$</td></tr> <tr> <td>$50 < f_d \leq 55$</td><td>$10 + 242 \log(f_d/50)$</td><td>$26 + 145 \log(f_d/50)$</td></tr> <tr> <td>$55 < f_d \leq 100$</td><td>$20 + 31 \log(f_d/55)$</td><td>$32 + 31 \log(f_d/55)$</td></tr> <tr> <td>$100 < f_d \leq 150$</td><td>$28 + 68 \log(f_d/100)$</td><td>$40 + 57 \log(f_d/100)$</td></tr> <tr> <td>$f_d > 150$</td><td>40</td><td>50 dB or $55 + 10 \log(P)$ dB, whichever is the lesser attenuation.</td></tr> </tbody> </table> f_d is the percentage of the equipment's channel bandwidth. 10.2 Output Power

Requirement(s):

Spec	Requirement	Applicable																		
FCC §2.1046 FCC §90.1215(a) RSS-111	Per FCC §90.1215, the transmitting power of stations operating in the 4940-4990 MHz band must not exceed the maximum limits in this section. The maximum conducted output power should not exceed: <table><thead><tr><th>Channel bandwidth (MHz)</th><th>Low power maximum conducted output power (dBm)</th><th>High power maximum conducted output power (dBm)</th></tr></thead><tbody><tr><td>1</td><td>7</td><td>20</td></tr><tr><td>5</td><td>14</td><td>27</td></tr><tr><td>10</td><td>17</td><td>30</td></tr><tr><td>15</td><td>18.8</td><td>31.8</td></tr><tr><td>20</td><td>20</td><td>33</td></tr></tbody></table> However, high power point-to-point and point-to-multipoint operations (both fixed and temporary-fixed rapid deployment) may employ transmitting antennas with directional gain up to 26 dBi without any corresponding reduction in the maximum conducted output power or spectral density. Corresponding reduction in the maximum conducted output power and peak power spectral density should be the amount in decibels that the directional gain of the antenna exceeds 26 dBi.	Channel bandwidth (MHz)	Low power maximum conducted output power (dBm)	High power maximum conducted output power (dBm)	1	7	20	5	14	27	10	17	30	15	18.8	31.8	20	20	33	☒
Channel bandwidth (MHz)	Low power maximum conducted output power (dBm)	High power maximum conducted output power (dBm)																		
1	7	20																		
5	14	27																		
10	17	30																		
15	18.8	31.8																		
20	20	33																		
Test Setup	 Spectrum Analyzer																			
Test Procedure	The maximum conducted output power is measured as a conducted emission over any interval of continuous transmission using instrumentation calibrated in terms of an RMS-equivalent voltage. If the device cannot be connected directly, alternative techniques acceptable to the Commission may be used. The measurement results shall be properly adjusted for any instrument limitations, such as detector response times, limited resolution bandwidth capability when compared to the emission bandwidth, sensitivity, etc., so as to obtain a true maximum conducted output power measurement.																			
Environmental conditions	Temperature (°C) Humidity (%) Atmospheric (mbar)	23 °C 40% 1019 mbar																		
Test Date	03/07/2016 – 03/11/2016																			
Remark	The two antennas are cross-polarized, so the directional gain = 26dBi.																			
Result	☒ Pass ☐ Fail																			

Test Data ☒ Yes ☐ N/A

Test Plot ☒ Yes (See below) ☐ N/A

10.3 Power Spectral Density

Requirement(s):

Spec	Requirement	Applicable
FCC §2.1046 FCC §90.1215 RSS-111	High power devices using channel bandwidths other than those listed above are permitted; however, they are limited to peak power spectral density of 21 dBm/MHz. If transmitting antennas of directional gain greater than 9 dBi are used, both the maximum conducted output power and the peak power spectral density should be reduced by the amount in decibels that the directional gain of the antenna exceeds 9 dBi. However, high power point-to-point and point-to-multipoint operations (both fixed and temporary-fixed rapid deployment) may employ transmitting antennas with directional gain up to 26 dBi without any corresponding reduction in the maximum conducted output power or spectral density. Corresponding reduction in the maximum conducted output power and peak power spectral density should be the amount in decibels that the directional gain of the antenna exceeds 26 dBi.	☒
Test Setup		
Test Procedure	The peak power spectral density is measured as conducted emission by direct connection of a calibrated test instrument to the equipment under test. Measurements are made over a bandwidth of one MHz or the 26 dB emission bandwidth of the device, whichever is less. A resolution bandwidth less than the measurement bandwidth can be used, provided that the measured power is integrated to show total power over the measurement bandwidth.	
Environmental conditions	Temperature (°C) Humidity (%) Atmospheric (mbar)	23 °C 40% 1019 mbar
Test Date	03/07/2016 – 03/11/2016	
Remark	The two antennas are cross-polarized, so the directional gain = 26dBi.

$45 < f_d \leq 50$	$219 \log(f_d/45)$	$568 \log(f_d/45)$																							
$50 < f_d \leq 55$	$10 + 242 \log(f_d/50)$	$26 + 145 \log(f_d/50)$																							
$55 < f_d \leq 100$	$20 + 31 \log(f_d/55)$	$32 + 31 \log(f_d/55)$																							
$100 < f_d \leq 150$	$28 + 68 \log(f_d/100)$	$40 + 57 \log(f_d/100)$																							
$f_d > 150$	40	50 dB or $55 + 10 \log(P)$ dB, whichever is the lesser attenuation.																							
Test Setup																									
Test Procedure	1. The EUT was switched on and allowed to warm up to its normal operating condition. 2. Measurement was made at a distance of 3 m. 3. The measuring antenna was set to 1.5 meter away from the ground plain. 4. Maximization of the emissions was carried out by rotating the EUT, and adjusting the antenna azimuth. 5. The test was done in both horizontal and vertical antenna polarizations. 6. The measurement shall be made with the transmitter set to the lowest operating frequency and with the transmitter set to the highest operating frequency																								
Remark	EUT was tested with antenna port terminated by a 50Ohm load.																								
Result	☒ Pass ☐ Fail
