

Test Report

Product Name : Philips 900/1800/1900
Model No. : Xenium9@9m
FCC ID No. : T38CT9A9M

Applicant : Cellon Communications Technology (Shenzhen) Co.,Ltd.
Address : 13/F, Skyworth C Building, Gaoxin S.Ave1, Hi-Tech
Industrial Park, Nanshan, Shenzhen, China

Date of Receipt : 2006/09/18
Issued Date : 2006/09/28
Report No. : 069S017-HP-US-P05V01

The test results relate only to the samples tested.

The test results shown in the test report are traceable to the national/international standard through the calibration of the equipment and evaluated measurement uncertainty herein.

This report must not be used to claim product endorsement by CNLA, NVLAP or any agency of the Government.
The test report shall not be reproduced except in full without the written approval of QuieTek Corporation.

Test Report Certification

Issued Date : 2006/09/28

Report No. : 069S017-HP-US-P05V01

Product Name : Philips 900/1800/1900
 Applicant : Cellon Communications Technology (Shenzhen) Co.,Ltd.

Laboratory Information

We , **Quietek Corporation**, are an independent EMC and safety consultancy that was established the whole facility in our laboratories. The test facility has been accredited by the following accreditation Bodies in compliance with ISO 17025, EN 45001 and Guide 25:

Taiwan R.O.C.	:	BSMI, DGT, CNLA
Germany	:	TUV Rheinland
Norway	:	Nemko, DNV
USA	:	FCC, NVLAP
Japan	:	VCCI

The related certificate for our laboratories about the test site and management system can be downloaded from Quietek Corporation's Web Site : <http://tw.quietek.com/modules/myalbum/>

The address and introduction of Quietek Corporation's laboratories can be founded in our Web site : <http://www.quietek.com/>

If you have any comments, Please don't hesitate to contact us. Our contact information is as below:

1. General Information

1.1. EUT Description

Product Name	Philips 900/1800/1900
Trade Name	Philips
Model No.	Xenium9@9m
FCC ID No.	T38CT9A9M
Tx Frequency	1850MHz ~ 1910MHz
Rx Frequency	1930MHz ~ 1990MHz
Hardware version	X-Tablet PR2
Software version	0846020206030000
Antenna Type	PIFA
Antenna Gain	0.87dBi

Component	
Power Adapter	M/N: DSA-5W-05FEU 051072 Input: AC 100-240V, 50-60Hz, 0.2A Output: DC 5.1V, 0.72A Cable Out: Non-Shielded, 1.2m

1.2. Operational Description

The information contained within this report is intended to show verification of compliance of the 1900MHz Mobile Phone to the requirements of 47CFR2 and CFR 24.

The EUT operates from a 120Vac/60Hz adapter where GSM is power Class 1, Operating with a maximum output power of 1 watt and GPRS is Multislot Class 10.

1.3. Mode of Operation

Quietek has verified the construction and function in typical operation. All the test modes were carried out with the EUT in normal operation, which was shown in this test report and defined as:

Pre-Test Mode
Mode 1: PCS1900 GSM
Mode 2: PCS1900 GPRS
Final Test Mode
Mode 1: PCS1900 GSM
Mode 2: PCS1900 GPRS

Note:

This device is a composite device in accordance with Part 15 Subpart B regulations. The function for the receiver was measured and made a test report that the report number is 069S017-HP-US-P01V01, certified under Declaration of Conformity.

1.4. Tested System Details

The types for all equipments, plus descriptions of all cables used in the tested system (including inserted cards) are:

Product		Manufacturer	Model No.	Serial No.	Power Cord
1	Radio Communication Tester	R&S	CMU 200	106388	Non-Shielded 1.8m

1.5. Configuration of Tested System

1.6. EUT Exercise Software

1	Setup the EUT and simulators as shown on 1.5;
2	Turn on the power of EUT;
3	EUT Communicate with CMU200

2. Technical Test

2.1. Summary of Test Result

- ☒ No deviations from the test standards
☐ Deviations from the test standards as below description:

For PCS1900 (FCC Part 24E &Part 2)

Emission			
Performed Item	Normative References	Test Performed	Deviation
Peak Output Power	FCC Part 24.232(b) and Part 2.1046	Yes	No
Modulation Characteristic	FCC Part 2.1047(d)	Yes	No
Occupied Bandwidth	FCC Part 24.238(b) and Part 2.1049	Yes	No

3. Peak Output Power

3.1. Test Specification

According to Part 24.232(b), 2.1046

3.2. Test Setup

Conducted Power Measurement

Radiated Power Measurement

3.3. Limit

The maximum peak power shall be less 2 Watt (33dBm).

3.4. Test Procedure

RF Out Power (Conducted)

Using a spectrum analyser and attenuator(s), the output power of the EUT was measured at the antenna terminals. The EUT supports both GSM and GPRS. The device is a class 0 module. The carrier was modulated by it's normal GMSK modulation and measurements performed with Timeslot 3(TS3) active.

RF Out Power (Radiated)

The Spectrum Analyzer was tuned to the test frequency. The device was put into Transmit mode then rotated through 360 degrees until the highest power level was observed in both horizontal and vertical polarization. The device was then replaced with a substitution antenna, which input signal was adjusted until the received level matched that of the previously detected emission.

3.5. Deviation from Test Standard

No deviation.

4. Modulation Characteristic

4.1. Test Specification

According to Part 2.1047(d)

4.2. Test Setup

4.3. Limit

N/A

4.4. Test Procedure

GMSK is a form of binary signaling schemes which represent digital states as a shift between discrete sinusoidal frequencies called Frequency Shift Keying (FSK). Minimum Shift Keying (MSK) is continuous phase FSK with the smallest possible modulation index h . Modulation index is defined as: $h = 2 \cdot F \cdot T_b$ where F = Peak frequency deviation in Hz and T_b = Bit period in seconds

Two discrete frequencies, representing two distinct digital states, with equal phases at switch time $t = 0$ requires a minimum value of $h = 0.5$. The Gaussian part of GMSK describes the fact that the digital pulses are filtered in the time domain. This results in bits which are sinusoidal rather than square. The effective spectrum is then compressed with the average carrier frequency in the center of the passband. This is a great advantage because of the significantly reduced bandwidth. GMSK is utilized because of these bandwidth conservation properties.

The bandwidth for GSM is a 60 MHz up-link at 1850-1910 MHz and down-link at 1930-1990 MHz. The 65 MHz is divided into 299 channels, each of which is 200 kHz wide. Slight spectral spillage is allowed into neighboring channels (which is minimized by GMSK). This

separated transmit/receive frequencies scheme under GSM enables easier duplex filtering.

Within the bandwidth, individual channels are subdivided into multiframes (made of 26 frames), frames (made of 8 time slots), and time slots (made of 8 fields). The time slots are 0.57 ms long allowing 156.25 bits of information including overhead.

The modulation used in GPRS is the same used in GSM. A GSM channel contains eight timeslots, each timeslot is dedicated to one circuit switched call. For GPRS the timeslots are assigned on an as needed basis, and more than one timeslot can be assigned for a particular transmission depending on the network and the device.

4.5. Deviation from Test Standard

No deviation.

According to Part 24.238(b), 2.1049

5.2. Test Setup

5.3. Limit

N/A

5.4. Test Procedure

For GSM

The EUT was set to transmit on maximum power and measurements were made on Timeslot 3.

For GPRS

The EUT was set to transmit on maximum power, (timeslots 3 and 4 active), and measurements were made on Timeslot 3.

Using a resolution bandwidth of 30kHz and a video bandwidth of 100kHz, the -26dBc points were established and the emission bandwidth determined. The plots below show the resultant display from the Spectrum Analyser.

5.5. Deviation from Test Standard

7. Spurious Emission

7.1. Test Specification

According to Part 24.238(b), 2.1051, 2.1053

7.2. Test Setup

Conducted Power Measurement

Radiated Power Measurement

7.3. Limit

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (p) by a factor of at least $43 + 10 \log(p)$ dB.

7.4. Test Procedure

In accordance with Part 2.1051, the spurious emissions from the antenna terminal were measured. The transmitter output power was attenuated using a combination of filters and attenuators and the frequency spectrum investigated from 9kHz to 20GHz. The EUT was set to transmit on full power. The EUT was tested on bottom, middle and top channels for both power levels. The resolution and video bandwidth was set to 1MHz in accordance with Part 24.238. The spectrum analyzer detector was set to Max Hold.

In addition, measurements were made up to the 10th harmonic of the fundamental.

The EUT is placed on a turn table which is 1.5 meter above ground. The turn table can rotate 360 degrees to determine the position of the maximum emission level. The EUT was positioned such that the distance from antenna to the EUT was 3 meters. The antenna can move up and down between 1 meter and 4 meters to find out the maximum emission level. Both horizontal and vertical polarization of the antenna are set on measurement. In order to find the maximum emission, all of the interface cables must be manipulated according to TIA/EIA 603-A on radiated measurement.

7.5. Deviation from Test Standard

No deviation.

7.6. Test Result

Product	Philips 900/1800/1900		
Test Item	Spurious Emission (Conducted)		
Test Mode	Mode 1: PCS1900 GSM		
Date of Test	2006/09/25	Date of Test	2006/09/25

Figure Channel 512 (1850.2MHz)

Figure Channel 661 (1880.0MHz)

Figure Channel 810 (1909.8MHz)

Product	Philips 900/1800/1900		
Test Item	Spurious Emission (Conducted)		
Test Mode	Mode 2: PCS1900 GPRS

8. Frequency Stability Under Temperature & Voltage Variations

8.1. Test Specification

According to Part 24.235, 2.1055

8.2. Test Setup

8.3. Limit

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

Limit	$< \pm 1$ ppm
-------	---------------

8.4. Test Procedure

For GSM

The EUT was set to transmit on maximum power and measurements were made on Timeslot3. Universal Radio Communication Tester, (CMU200), was used to measure The Frequency Error. The maximum result of measurements made over 200 bursts was recorded.

For GPRS

The EUT was set to transmit on maximum power, (timeslots 3 and 4 active), and measurements performed on Timeslot 3. A Universal Radio Communication Tester, (CMU200), was used to measure the frequency error. The maximum result of measurements made over 200 bursts was recorded.

8.5. Deviation from Test Standard

No deviation.

8.6. Test Result

Product	Philips 900/1800/1900		
Test Item	Frequency Stability Under Temperature & Voltage Variations		
Test Mode	Mode 1: PCS1900 GSM		
Date of Test	2006/09/25	Date of Test	2006/09/25

Frequency Stability Under Temperature

Temperature Interval(°C)	Test Frequency (MHz)	Deviation (Hz)	Limit (KHz)
-30	1880.0	-37	±1.88
-20	1880.0	40	±1.88
-10	1880.0	44	±1.88
0	1880.0	47	±1.88
10	1880.0	55	±1.88
20	1880.0	57	±1.88
30	1880.0	45	±1.88
40	1880.0	-58	±1.88
50	1880.0	-51	±1.88

Frequency Stability Under Voltage

DC Voltage (V)	Test Frequency (MHz)	Deviation (Hz)	Limit (KHz)
3.52	1880.0	-56	±1.88
3.7	1880.0	-54	±1.88
4.225	1880.0	-54	±1.88
