Competences and guarantees

DEKRA Testing and Certification S.A.U. is a testing laboratory accredited by the National Accreditation Body (ENAC -Entidad Nacional de Acreditación), to perform the tests indicated in the Certificate No. 51/LE 147.

DEKRA Testing and Certification is a FCC-recognized accredited testing laboratory with appropriate scope of accreditation that include testing performed in this test report.

DEKRA Testing and Certification is an ISED-recognized accredited testing laboratory with appropriate scope of accreditation that include testing performed in this test report.

In order to assure the traceability to other national and international laboratories, DEKRA Testing and Certification S.A.U. has a calibration and maintenance program for its measurement equipment.

DEKRA Testing and Certification S.A.U. guarantees the reliability of the data presented in this report, which is the result of the measurements and the tests performed to the item under test on the date and under the conditions stated on the report and, it is based on the knowledge and technical facilities available at DEKRA Testing and Certification S.A.U. at the time of performance of the test.

DEKRA Testing and Certification S.A.U. is liable to the client for the maintenance of the confidentiality of all information related to the item under test and the results of the test.

The results presented in this Test Report apply only to the particular item under test established in this document.

IMPORTANT: No parts of this report may be reproduced or quoted out of context, in any form or by any means, except in full, without the previous written permission of DEKRA Testing and Certification S.A.U.

General conditions

1. This report is only referred to the item that has undergone the test.
2. This report does not constitute or imply on its own an approval of the product by the Certification Bodies or competent Authorities.
3. This document is only valid if complete; no partial reproduction can be made without previous written permission of DEKRA Testing and Certification S.A.U.
4. This test report cannot be used partially or in full for publicity and/or promotional purposes without previous written permission of DEKRA Testing and Certification S.A.U. and the Accreditation Bodies.

Uncertainty

Uncertainty (factor $k=2$) was calculated according to the DEKRA Testing and Certification S.A.U. internal document PODT000.

Data provided by the client

The following data has been provided by the client:

1. Information relating to the description of the sample ("Identification of the item tested", "Trademark", "Model and/or type reference tested").
2. The sample of the model 19239 is a system that aims to offer telematic services and the device acts like gateway, receiving and transmitting data.

DEKRA Testing and Certification S.A.U. declines any responsibility with respect to the information provided by the client and that may affect the validity of results.

Usage of samples

Samples undergoing test have been selected by: The client.

- Sample S/01 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
64195C/028	Telematics Control Unit	19239	9d99E039	2020-06-01
64195C/020	Harness	--	--	2020-03-25
64195C/013	Metallic mounting bracket	--	--	2020-03-25

Sample S/01 has undergone the test(s): The Radiated tests indicated in the Appendixes A, B, C.

- Sample S/02 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
64195C/005	Telematics Control Unit	19239	--	2020-03-25
64195C/024	Harness	--	--	2020-03-25
64195C/013	Metallic mounting bracket	--	--	2020-03-25

Sample S/02 has undergone the test(s): The Radiated tests indicated in the Appendixes D and E.

Environmental conditions

In the control chamber, the following limits were not exceeded during the test:

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %

In the semianechoic chamber, the following limits were not exceeded during the test.

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %

Remarks and comments

The tests have been performed by the technical personnel: Cristina Calle, Francisco Jesús Olmo and Nicolás Salguero.

Used instrumentation:

TEST CONDITIONS12

Radiated emissions.....14

TEST CONDITIONS

POWER SUPPLY (V):

V nominal: 12 Vdc

Type of Power Supply: DC external (car battery).

ANTENNA:

Type of Antennas: Internal (SMD).

Maximum Declared Gain for Bluetooth LE: +2.2 dBi

Maximum Declared Gain for CELLULAR:

LOW Bands	GAIN	ANTENNA TYPE
LTE Band 5	+3.5 dBi	Internal (SMD)
LTE Band 26	+3.5 dBi	Internal (SMD)

TEST FREQUENCIES:

Based on preliminary testing that identified those corresponding to the worst cases (with the highest E.I.R.P.):

	CELLULAR LTE Bands 5, 26	
Band:	LTE Band 5	
Frequency Range:	824 – 849 MHz	
Channel Spacing:	200 KHz	
Transmit Channel:	Channel	Channel Frequency (MHz)
	Low: 20425	826.5 MHz
Band:	LTE Band 26	
Frequency Range:	824 – 849 MHz	
Transmit Channel:	Channel	Channel Frequency (MHz)
	Middle: 26865	831.5 MHz
Band:	LTE Band 26	
Frequency Range:	814 – 824 MHz	
Transmit Channel:	Channel	Channel Frequency (MHz)
	High: 26790	824 MHz

	Bluetooth LE	
Mode:	GFSK	
Channel Spacing:	1 MHz	
Frequency Range:	2400 MHz to 2483.5 MHz	
Transmit Channel:	Channel	Channel Frequency (MHz)
	Middle: 17	2440

The test set-up was made in accordance to the general provisions of FCC DTS Measurement 558074 D01 DTS Meas Guidance v05r02 dated April 2, 2019.

The EUT was tested in the following operating mode:

- Continuous transmission with a modulated carrier at maximum power in all required channels selecting the supported data rates/modulations types.

During transmitter test the EUT was being controlled by the SW tool to operate in a continuous transmit mode on the test channel as required and in each of the different modulation modes.

Selected Transmission Modes for each Radio:

The following configurations were selected based on preliminary testing that identified those corresponding to the worst cases:

* Cellular LTE: Transmitter radiated spurious emissions tests were performed with the EUT transmitting in:

Cellular LTE Band 5 / Low Channel configuration.

Cellular LTE Band 26 / range 824-849 MHz (BW=15 MHz) in the Middle Channel configuration.

Cellular LTE Band 26 / range 814-824 MHz in the High Channel configuration.

These channels were found to transmit higher EIRP than all the other LTE channels.

* Bluetooth Low Energy: Transmitter radiated spurious emissions tests were performed with the EUT transmitting in Bluetooth Low Energy / Middle Channel and GFSK mode configuration.

TESTED SIMULTANEOUS TRANSMISSION MODES:

* **Co-location mode LTE Band 5, Bluetooth Low Energy**, with the EUT configured to simultaneously transmit two signals at maximum output power, Cellular LTE Band 5 / Low Channel and Bluetooth Low Energy / Middle Channel and GFSK.

* **Co-location mode LTE Band 26 range 824-849 MHz, Bluetooth Low Energy**, with the EUT configured to simultaneously transmit two signals at maximum output power, Cellular LTE Band 26 range 824-849 MHz / (BW=15 MHz) Middle Channel and Bluetooth Low Energy / Middle Channel and GFSK.

* **Co-location mode LTE Band 26 range 814-824 MHz, Bluetooth Low Energy**, with the EUT configured to simultaneously transmit two signals at maximum output power, Cellular LTE Band 26 range 814-824 MHz / High Channel and Bluetooth Low Energy / Middle Channel and GFSK.

Radiated emissions

SPECIFICATION:

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c) / RSS-Gen):

Frequency Range (MHz)	Field strength (µV/m)	Field strength (dBµV/m)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RSS-247. Attenuation below the general field strength limits specified in RSS-Gen is not required.

1. LTE Band 5 and LTE Band 26 (range 824-849 MHz). FCC §2.1053 & §22.917 / RSS-132 Clause 5.5.

FCC §22.917:

(a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

RSS-132 Clause 5.5:

- i. In the first 1.0 MHz band immediately outside and adjacent to each of the sub-bands specified in Section 5.1, the power of emissions per any 1% of the occupied bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} p$ (watts).
- ii. After the first 1.0 MHz immediately outside and adjacent to each of the sub-bands, the power of emissions in any 100 kHz bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} p$ (watts). If the measurement is performed using 1% of the occupied bandwidth, power integration over 100 kHz is required.

2. LTE Band 26 (range 814-824 MHz). FCC §2.1051, §90.691.

FCC §2.1051, §90.691:

Emission mask requirements for EA-based systems.

For any frequency removed from the EA licensee's frequency block greater than 37.5 kHz, the power of any emission shall be attenuated below the transmitter power (P) in watts by at least $43 + 10 \log_{10}(P)$ decibels or 80 decibels, whichever is the lesser attenuation, where f is the frequency removed from the center of the outer channel in the block in kilohertz and where f is greater than 37.5 kHz.

METHOD:

The measurement was performed with the EUT inside an anechoic chamber.

The spectrum was scanned from 30 MHz to at least the 10th harmonic of the highest frequency of the co-located radios till 26 GHz.

The EUT was placed on a non-conductive stand at a 3 meter distance from the measuring antenna. Detected emissions were maximized at each frequency by rotating the EUT and adjusting the measuring antenna height and polarization. The maximum meter reading was recorded.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

These measurements have been performed in order to check the impact of the Co-Location of all radio interfaces (that can be transmitting simultaneously).

TEST SETUP:

Radiated measurements below 1 GHz.

Radiated measurements setup from 1GHz to 17 GHz:

Radiated measurements setup $f > 17$ GHz:

RESULTS:

• Co-Location mode LTE Band 5, Bluetooth Low Energy:

QPSK & 16QAM:

A preliminary scan determined the QPSK modulation as the worst case.

LTE Band 5: BW: 5 MHz. Low Channel (826.5 MHz). RB Size: 1. RB Offset: 0.
Bluetooth Low Energy: Middle Channel (2440 MHz). GFSK.

LIMIT: The spurious frequencies were measured at 3 meter. The limit of the test is determined by:

Frequency Range	Detector	Limit at 3m (dB μ V/m)
30 MHz to 8.49 GHz	Peak	43 + 10 log (P) dB = -13 dBm -> 82.23 dB μ V/m
8.49 to 26 GHz	Peak	74 dB μ V/m (*)
	Average	54 dB μ V/m (*)

(*) Radiated emissions which fall in the restricted bands, as defined in §15.205(a).

Frequency range 30 MHz - 1 GHz

No spurious frequencies at less than 20 dB below the limit.

Frequency range 1 - 26 GHz

Spurious frequencies at less than 20 dB below the limit:

Spurious frequency (GHz)	Polarization	Detector	E (dB μ V/m)
1.64877	H	Peak	65.28

Measurement uncertainty (dB)	$\leq \pm 4.65$ for $f < 1$ GHz $\leq \pm 4.98$ for $f \geq 1$ GHz up to 17 GHz $\leq \pm 5.08$ for $f \geq 17$ GHz up to 26 GHz
------------------------------	--

Verdict: PASS

FREQUENCY RANGE 30 MHz - 1 GHz (worst case):

The peak above the limit is the carrier frequency LTE Band 5 (826.5 MHz).

FREQUENCY RANGE 1 - 3 GHz (worst case):

The peak above the limit is the carrier frequency Bluetooth Low Energy (2440 MHz).

FREQUENCY RANGE 3 – 17 GHz (worst case):

FREQUENCY RANGE 17 - 26 GHz (worst case):

- **Co-Location mode LTE Band 26 range 824-849, Bluetooth Low Energy:**

QPSK & 16QAM:

A preliminary scan determined the QPSK modulation as the worst case.

LTE Band 26: BW: 15 MHz. Middle Channel (831.5 MHz). RB Size: 1. RB Offset: 0.
Bluetooth Low Energy: Middle Channel (2440 MHz). GFSK.

LIMIT: The spurious frequencies were measured at 3 meter. The limit of the test is determined by:

Frequency Range	Detector	Limit at 3m (dBμV/m)
30 MHz to 8.49 GHz	Peak	$43 + 10 \log (P) \text{ dB} = -13 \text{ dBm} \rightarrow 82.23 \text{ dB}\mu\text{V/m}$
8.49 to 26 GHz	Peak	74 dBμV/m (*)
	Average	54 dBμV/m (*)

(*) Radiated emissions which fall in the restricted bands, as defined in §15.205(a).

Frequency range 30 MHz - 1 GHz

No spurious frequencies at less than 20 dB below the limit.

Frequency range 1 - 26 GHz

Spurious frequencies at less than 20 dB below the limit:

Spurious frequency (GHz)	Polarization	Detector	E (dBμV/m)
1.64990	H	Peak	65.89

Measurement uncertainty (dB)	$< \pm 4.65$ for $f < 1 \text{ GHz}$ $< \pm 4.98$ for $f \geq 1 \text{ GHz}$ up to 17 GHz $< \pm 5.08$ for $f \geq 17 \text{ GHz}$ up to 26 GHz
------------------------------	---

Verdict: PASS

FREQUENCY RANGE 30 MHz - 1 GHz (worst case):

The peak above the limit is the carrier frequency LTE Band 26 range 824-849 MHz (831.5 MHz).

FREQUENCY RANGE 1 - 3 GHz (worst case):

The peak above the limit is the carrier frequency Bluetooth Low Energy (2440 MHz).

FREQUENCY RANGE 3 – 17 GHz (worst case):

FREQUENCY RANGE 17 - 26 GHz (worst case):

- **Co-Location mode LTE Band 26 range 814-824, Bluetooth Low Energy:**

QPSK & 16QAM:

A preliminary scan determined the QPSK modulation as the worst case.

LTE Band 26: BW: 1.4 MHz. High Channel (824 MHz). RB Size: 1. RB Offset: 0.
Bluetooth Low Energy: Middle Channel (2440 MHz). GFSK.

LIMIT: The spurious frequencies were measured at 3 meter. The limit of the test is determined by:

Frequency Range	Detector	Limit at 3m (dBμV/m)
30 MHz to 8.24 GHz	Peak	$43 + 10 \log (P) \text{ dB} = -13 \text{ dBm} \rightarrow 82.23 \text{ dB}\mu\text{V/m}$
8.24 to 26 GHz	Peak	74 dBμV/m (*)
	Average	54 dBμV/m (*)

(*) Radiated emissions which fall in the restricted bands, as defined in §15.205(a).

Frequency range 30 MHz - 1 GHz

No spurious frequencies at less than 20 dB below the limit.

Frequency range 1 - 26 GHz

Spurious frequencies at less than 20 dB below the limit:

Spurious frequency (GHz)	Polarization	Detector	E (dBμV/m)
1.64703	H	Peak	65.88

Measurement uncertainty (dB)	$< \pm 4.65$ for $f < 1 \text{ GHz}$ $< \pm 4.98$ for $f \geq 1 \text{ GHz}$ up to 17 GHz $< \pm 5.08$ for $f \geq 17 \text{ GHz}$ up to 26 GHz
------------------------------	---

Verdict: PASS

FREQUENCY RANGE 30 MHz - 1 GHz (worst case):

The peak above the limit is the carrier frequency LTE Band 26 range 814-824 MHz (824 MHz).

FREQUENCY RANGE 1 - 3 GHz (worst case):

The peak above the limit is the carrier frequency Bluetooth Low Energy (2440 MHz).

FREQUENCY RANGE 3 – 17 GHz (worst case):

FREQUENCY RANGE 17 - 26 GHz (worst case):

Mode:	GFSK	
Channel Spacing:	1 MHz	
Frequency Range:	2400 MHz to 2483.5 MHz	
Transmit Channel:	Channel	Channel Frequency (MHz)
	Middle: 17	2440

The test set-up was made in accordance to the general provisions of FCC DTS Measurement 558074 D01 DTS Meas Guidance v05r02 dated April 2, 2019.

The EUT was tested in the following operating mode:

- Continuous transmission with a modulated carrier at maximum power in all required channels selecting the supported data rates/modulations types.

During transmitter test the EUT was being controlled by the SW tool to operate in a continuous transmit mode on the test channel as required and in each of the different modulation modes.

Selected Transmission Modes for each Radio:

The following configurations were selected based on preliminary testing that identified those corresponding to the worst cases:

* Cellular LTE: Transmitter radiated spurious emissions tests were performed with the EUT transmitting in: Cellular LTE Band 2 / High Channel configuration.
This channel was found to transmit higher EIRP than all the other LTE channels.

* Bluetooth Low Energy: Transmitter radiated spurious emissions tests were performed with the EUT transmitting in Bluetooth Low Energy / Middle Channel and GFSK mode configuration.

TESTED SIMULTANEOUS TRANSMISSION MODES:

* **Co-location mode LTE Band 2, Bluetooth Low Energy**, with the EUT configured to simultaneously transmit two signals at maximum output power, Cellular LTE Band 2 / High Channel and Bluetooth Low Energy / Middle Channel and GFSK.

Radiated emissions

SPECIFICATION:

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c) / RSS-Gen):

Frequency Range (MHz)	Field strength (µV/m)	Field strength (dBµV/m)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RSS-247. Attenuation below the general field strength limits specified in RSS-Gen is not required.

1. LTE Band 2. FCC §2.1053 & §24.238 / RSS-133 Clause 6.5.

FCC §24.238:

(a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

RSS-133 Clause 6.5:

- i. In the 1.0 MHz bands immediately outside and adjacent to the equipment's operating frequency block, the emission power per any 1% of the emission bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10}(P)$ (watts).
- ii. After the first 1.0 MHz, the emission power in any 1 MHz bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10}(P)$ (watts). If the measurement is performed using 1% of the emission bandwidth, power integration over 1.0 MHz is required.

METHOD:

The measurement was performed with the EUT inside an anechoic chamber.

The spectrum was scanned from 30 MHz to at least the 10th harmonic of the highest frequency of the co-located radios till 26 GHz.

The EUT was placed on a non-conductive stand at a 3 meter distance from the measuring antenna. Detected emissions were maximized at each frequency by rotating the EUT and adjusting the measuring antenna height and polarization. The maximum meter reading was recorded.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

These measurements have been performed in order to check the impact of the Co-Location of all radio interfaces (that can be transmitting simultaneously).

TEST SETUP:

Radiated measurements below 1 GHz.

Radiated measurements setup from 1GHz to 17 GHz:

Radiated measurements setup $f > 17$ GHz:

RESULTS:

• Co-Location mode LTE Band 2, Bluetooth Low Energy:

QPSK & 16QAM:

A preliminary scan determined the QPSK modulation as the worst case.

LTE Band 2: BW: 15 MHz. High Channel (1902.5 MHz). RB Size: 1. RB Offset: 0.
Bluetooth Low Energy: Middle Channel (2440 MHz).

LIMIT: The spurious frequencies were measured at 3 meter. The limit of the test is determined by:

Frequency Range	Detector	Limit at 3m (dBμV/m)
30 MHz to 19.1 GHz	Peak	$43 + 10 \log (P) \text{ dB} = -13 \text{ dBm} \rightarrow 82.23 \text{ dB}\mu\text{V/m}$
19.1 GHz to 26 GHz	Peak	74 dBμV/m (*)
	Average	54 dBμV/m (*)

(*) Radiated emissions which fall in the restricted bands, as defined in §15.205(a).

Frequency range 30 MHz - 1 GHz

No spurious frequencies at less than 20 dB below the limit.

Frequency range 1 – 26 GHz

No spurious frequencies at less than 20 dB below the limit.

Measurement uncertainty (dB)	$<\pm 4.65$ for $f < 1 \text{ GHz}$ $<\pm 4.98$ for $f \geq 1 \text{ GHz}$ up to 17 GHz $<\pm 5.08$ for $f \geq 17 \text{ GHz}$ up to 26 GHz
------------------------------	--

Verdict: PASS

FREQUENCY RANGE 30 MHz - 1 GHz (worst case):

FREQUENCY RANGE 1 – 3 GHz (worst case):

The peak above the limit on the left is the carrier frequency LTE Band 2 (1902.5 MHz).

The peak above the limit on the right is the carrier frequency Bluetooth Low Energy (2440 MHz).

FREQUENCY RANGE 3 – 18 GHz (worst case):

FREQUENCY RANGE 18 - 26 GHz (worst case):

* **Co-location mode LTE Band 13, Bluetooth Low Energy**, with the EUT configured to simultaneously transmit two signals at maximum output power, Cellular LTE Band 13 / Middle Channel and Bluetooth Low Energy / Middle Channel and GFSK.

Radiated emissions

SPECIFICATION:

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c) / RSS-Gen):

Frequency Range (MHz)	Field strength (µV/m)	Field strength (dBµV/m)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RSS-247. Attenuation below the general field strength limits specified in RSS-Gen is not required.

1. LTE Band 4. FCC §2.1053 & §27.53 (h) / RSS-139 6.6.

FCC §27.53 (h):

(h) Except as otherwise specified below, for operations in the 1695-1710 MHz, 1710-1755 MHz, 1755-1780 MHz, 1915-1920 MHz, 1995-2000 MHz, 2000-2020 MHz, 2110-2155 MHz, 2155-2180 MHz, and 2180-2200 MHz, the power of any emission outside a licensee's frequency block shall be attenuated below the transmitter power (P) in watts by at least $43 + 10 \log_{10} (P)$ dB.

RSS-139 6.6:

- i. In the first 1.0 MHz bands immediately outside and adjacent to the equipment's smallest operating frequency block, which can contain the equipment's occupied bandwidth, the emission power per any 1% of the emission bandwidth shall be attenuated below the transmitter output power P (in dBW) by at least $43 + 10 \log_{10} P$ (watts) dB.
- ii. After the first 1.0 MHz outside the equipment's smallest operating frequency block, which can contain the equipment's occupied bandwidth, the emission power in any 1 MHz bandwidth shall be attenuated below the transmitter output power P (in dBW) by at least $43 + 10 \log_{10} P$ (watts) dB.

2. LTE Band 12. FCC §2.1053 & §27.53 (g) / RSS-130 Issue 1 4.6.

FCC §27.53 (g):

(g) For operations in the 600 MHz band and the 698-746 MHz band, the power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log (P)$ dB. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kilohertz or greater. However, in the 100 kilohertz bands immediately outside and adjacent to a licensee's frequency block, a resolution bandwidth of at least 30 kHz may be employed.

RSS-130 Issue 1 Clause 4.6.:

The power of any unwanted emissions in any 100 kHz bandwidth on any frequency outside the frequency range(s) within which the equipment is designed to operate shall be attenuated below the transmitter power, P (dBW), by at least $43 + 10 \log_{10} p$ (watts), dB. However, in the 100 kHz band immediately outside the equipment's operating frequency range, a resolution bandwidth of 30 kHz may be employed.

3. LTE Band 13. FCC §2.1053 & §27.53 (c) (2) (4) & (f) / RSS-130 Issue 1, 4.6.1.

FCC §27.53 (c) (2) (4) & (f):

(c) (2) On any frequency outside the 776-788 MHz band, the power of any emission shall be attenuated outside the band below the transmitter power (P) by at least $43 + 10 \log (P)$ dB.

(c) (4) On all frequencies between 763-775 MHz and 793-805 MHz, by a factor not less than $65 + 10 \log (P)$ dB in a 6.25 kHz band segment, for mobile and portable stations.

(f) For operations in the 746-758 MHz, 775-788 MHz, and 805-806 MHz bands, emissions in the band 1559-1610 MHz shall be limited to -70 dBW (-40 dBm)/MHz equivalent isotropically radiated power (EIRP) for wideband signals, and -80 dBW (-50 dBm) EIRP for discrete emissions of less than 700 Hz bandwidth. For the purpose of equipment authorization, a transmitter shall be tested with an antenna that is representative of the type that will be used with the equipment in normal operation.

RSS-130 Issue 1, 4.6.1:

4.6.1. The power of any unwanted emissions in any 100 kHz bandwidth on any frequency outside the frequency range(s) within which the equipment is designed to operate shall be attenuated below the transmitter power, P (dBW), by at least $43 + 10 \log_{10} p$ (watts), dB. However, in the 100 kHz band immediately outside the equipment's operating frequency range, a resolution bandwidth of 30 kHz may be employed.

METHOD:

The measurement was performed with the EUT inside an anechoic chamber.

The spectrum was scanned from 30 MHz to at least the 10th harmonic of the highest frequency of the co-located radios till 26 GHz.

The EUT was placed on a non-conductive stand at a 3 meter distance from the measuring antenna.

Detected emissions were maximized at each frequency by rotating the EUT and adjusting the measuring antenna height and polarization. The maximum meter reading was recorded.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

These measurements have been performed in order to check the impact of the Co-Location of all radio interfaces (that can be transmitting simultaneously).

TEST SETUP:

Radiated measurements below 1 GHz.

Radiated measurements setup from 1GHz to 17 GHz:

Radiated measurements setup $f > 17$ GHz:

RESULTS:

- Co-Location mode LTE Band 4, Bluetooth Low Energy.**

QPSK and 16QAM:

A preliminary scan determined QPSK modulation as the worst case.

LTE Band 4: BW: 1.4 MHz. Low Channel (1710.7 MHz). RB Size: 1. RB Offset: 0.
Bluetooth Low Energy: Middle Channel (2440 MHz).

LIMIT: The spurious frequencies were measured at 3 meter. The limit of the test is determined by:

Frequency Range	Detector	Limit at 3m (dBμV/m)
30 MHz to 17.55 GHz	Peak	$43 + 10 \log (P) \text{ dB} = -13 \text{ dBm} \rightarrow 82.23 \text{ dB}\mu\text{V/m}$
17.55 GHz to 26 GHz	Peak	74 dBμV/m (*)
	Average	54 dBμV/m (*)

(*) Radiated emissions which fall in the restricted bands, as defined in §15.205(a).

Frequency range 30 MHz - 1 GHz

No spurious frequencies detected at less than 20 dB below the limit.

Frequency range 1 - 26 GHz

No spurious frequencies detected at less than 20 dB below the limit.

Measurement uncertainty (dB)	$\leq \pm 4.65$ for $f < 1 \text{ GHz}$ $\leq \pm 4.98$ for $f \geq 1 \text{ GHz}$ up to 17 GHz $\leq \pm 5.08$ for $f \geq 17 \text{ GHz}$ up to 26 GHz

The test set-up was made in accordance to the general provisions of FCC DTS Measurement 558074 D01 DTS Meas Guidance v05r02 dated April 2, 2019.

The EUT was tested in the following operating mode:

- Continuous transmission with a modulated carrier at maximum power in all required channels selecting the supported data rates/modulations types.

During transmitter test the EUT was being controlled by the SW tool to operate in a continuous transmit mode on

Selected Transmission Modes for each Radio:

The following configurations were selected based on preliminary testing that identified those corresponding to the worst cases:

* Bluetooth Low Energy: Transmitter radiated spurious emissions tests were performed with the EUT transmitting in Bluetooth Low Energy / Low Channel and GFSK mode configuration.

* SRD 125 kHz: Transmitter radiated spurious emissions tests were performed with the EUT transmitting in the single channel configuration supported by this radio.

TESTED SIMULTANEOUS TRANSMISSION MODES:

* **Co-location mode Bluetooth Low Energy, SRD 125 kHz**, with the EUT configured to simultaneously transmit two signals at maximum output power, Bluetooth Low Energy / Low Channel and GFSK, and SRD 125 kHz / Single Channel and ASK.

Radiated emissions

SPECIFICATION:

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c) / RSS-Gen):

Frequency Range (MHz)	Field strength ($\mu\text{V/m}$)	Field strength ($\text{dB}\mu\text{V/m}$)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RSS-247. Attenuation below the general field strength limits specified in RSS-Gen is not required.

METHOD:

The measurement was performed with the EUT inside an anechoic chamber.

The spectrum was scanned from 9 kHz to at least the 10th harmonic of the highest frequency of the co-located radios till 26 GHz.

The EUT was placed on a non-conductive stand at a 3 meter distance from the measuring antenna.

For radiated emissions in the range 9 kHz to 30 MHz that is performed at a distance closer than the specified distance, an inverse proportionality factor of 40 dB per decade is used to normalize the measured data for determining compliance.

In the range between 9 kHz and 30 MHz the measurements were made in the three different orientation planes of the loop antenna to determine the maximum received field.

Detected emissions were maximized at each frequency by rotating the EUT and adjusting the measuring antenna height and polarization. The maximum meter reading was recorded.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

These measurements have been performed in order to check the impact of the Co-Location of all radio interfaces (that can be transmitting simultaneously).

TEST CONDITIONS67

Radiated emissions.....69

TEST CONDITIONS

POWER SUPPLY (V):

V nominal: 12 Vdc
Type of Power Supply: DC External (car battery).

ANTENNA:

Type of Antenna for Bluetooth: Internal (SMD).
Maximum Declared Gain for Bluetooth LE: +2.2 dBi

Type of Antenna for SRD 433.92 MHz: Internal (helix).

TEST FREQUENCIES:

	Bluetooth LE	
Mode:	GFSK	
Channel Spacing:	1 MHz	
Frequency Range:	2400 MHz to 2483.5 MHz	
Transmit Channel:	Channel	Channel Frequency (MHz)
	Low: 37	2402

	SRD 433.92 MHz / FSK	
Mode:	Single Channel	
Channel Spacing:	Not Applicable	
Frequency Range:	433.92 MHz	
Transmit Channel:	Channel	Channel Frequency (MHz)
	Single: 1	433.92

The test set-up was made in accordance to the general provisions of FCC DTS Measurement 558074 D01 DTS Meas Guidance v05r02 dated April 2, 2019.

The EUT was tested in the following operating mode:

- Continuous transmission with a modulated carrier at maximum power in all required channels selecting the supported data rates/modulations types.

During transmitter test the EUT was being controlled by the SW tool to operate in a continuous transmit mode on

Selected Transmission Modes for each Radio:

The following configurations were selected based on preliminary testing that identified those corresponding to the worst cases:

* Bluetooth Low Energy: Transmitter radiated spurious emissions tests were performed with the EUT transmitting in Bluetooth Low Energy / Low Channel and GFSK mode configuration.

* SRD 433.92 MHz: Transmitter radiated spurious emissions tests were performed with the EUT transmitting in the single channel configuration supported by this radio.

TESTED SIMULTANEOUS TRANSMISSION MODES:

* **Co-location mode Bluetooth Low Energy, SRD 433.92 MHz**, with the EUT configured to simultaneously transmit two signals at maximum output power, Bluetooth Low Energy / Low Channel and GFSK, and SRD 433.92 MHz / Single Channel and FSK.

Radiated emissions

SPECIFICATION:

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c) / RSS-Gen):

Frequency Range (MHz)	Field strength ($\mu\text{V/m}$)	Field strength ($\text{dB}\mu\text{V/m}$)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RSS-247. Attenuation below the general field strength limits specified in RSS-Gen is not required.

FCC 15.231 (e), 15.209 (a) / RSS-Gen 8.9., RSS-210 A.1.2. Field strength and Emission limitations radiated (Transmitter).

The field strength of emissions from intentional radiators shall not exceed the following:

Fundamental frequency (MHz)	Field strength of fundamental ($\mu\text{V/m}$)	Field strength of spurious emission ($\mu\text{V/m}$)
40.66 – 40.70	1,000	100
70 – 130	500	50
130 - 174	500 to 1,500 **	50 to 150 **
174 - 260	1,500	150
260 - 470	1,500 to 5,000 **	150 to 500 **
Above 470	5,000	500

** : Linear Interpolations: The maximum permitted unwanted emission level is 20 dB below the maximum permitted fundamental level.

Spurious emissions shall be attenuated to the limits shown in the above table or to the general limits shown in Section 15.209 / RSS-Gen, whichever limit permits a higher field strength.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

METHOD:

The measurement was performed with the EUT inside an anechoic chamber.

The spectrum was scanned from 30 MHz to at least the 10th harmonic of the highest frequency of the co-located radios till 26 GHz.

The EUT was placed on a non-conductive stand at a 3 meter distance from the measuring antenna.

Detected emissions were maximized at each frequency by rotating the EUT and adjusting the measuring antenna height and polarization. The maximum meter reading was recorded.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

These measurements have been performed in order to check the impact of the Co-Location of all radio interfaces (that can be transmitting simultaneously).

TEST SETUP:

Radiated measurements below 1 GHz.

Radiated measurements setup from 1GHz to 17 GHz:

Radiated measurements setup $f > 17$ GHz:

RESULTS:

- Co-Location mode Bluetooth Low Energy, SRD 433.92 MHz.**

Bluetooth Low Energy: Low Channel (2402 MHz).
SRD 433.92 MHz: Single Channel (433.92 MHz).

Frequency range 30 MHz - 1 GHz

No spurious frequencies detected at less than 20 dB below the limit.

Frequency range 1 - 26 GHz

Spurious frequencies detected at less than 20 dB below the limit:

Spurious Frequency (GHz)	Emission Level (dBμV/m)	Duty Cycle Correction (dB)	Corrected Emission Level (dBμV/m)	Polarization	Detector
1.537499	56.01	-	56.01	V	Peak
	47.20	2.06	49.26		Average
4.80390	46.95	-	46.95	V	Peak
12.01110	50.35	-	50.35	H	Peak
19.21385	46.68	-	46.68	V	Peak

Measurement uncertainty (dB)	$\leq \pm 4.99$ for $f < 1$ GHz $\leq \pm 4.98$ for $f \geq 1$ GHz up to 17 GHz $\leq \pm 5.08$ for $f \geq 17$ GHz up to 26 GHz
------------------------------	--

Verdict: PASS

FREQUENCY RANGE 30 MHz - 1 GHz (worst case):

The peak above the limit is the carrier frequency SRD 433.92 MHz.

FREQUENCY RANGE 1 - 3 GHz (worst case):

The peak above the limit is the carrier frequency Bluetooth Low Energy (2402 MHz).

FREQUENCY RANGE 3 - 17 GHz (worst case):

FREQUENCY RANGE 17 - 26 GHz (worst case):
