1. Scope

This test report certifies that the Revolabs 10-FLXHDDIALER, FLX New Bluetooth Handset, as tested, meets the FCC Part 15.247, and Industry Canada RSS 210, Issue 8 requirements. The scope of this test report is limited to the test sample provided by the client, only in as much as that sample represents other production units. If any significant changes are made to the unit, the changes shall be evaluated and a retest may be required.

2. Product Details

- 2.1. Manufacturer: Revolabs, Inc.
- 2.2. Model Number: 10-FLXHDDIALER
- 2.3. Serial Number: 301000055491
- 2.4. Description: FLX New Bluetooth Handset
- 2.5. Power Source: 3.7 Volts DC (Custom L1-ion Battery)
- 2.6. EMC Modifications: None

3. Product Configuration

3.1. Operational Characteristics & Software

CSR BlueTest3 was used as the control software for the Bluetooth transmitter.

Notes: The default transmitter power settings set by the client were maintained throughout the testing.

To facilitate setting the required transmitter test modes, the following device hardware setup was used: A USB cable from the laptop containing the test software was attached to modified device under test.

The following test modes were utilized to perform the testing:

TXSTART – The transmitter transmits a single carrier on a selected frequency from channel 1 to 79.

TXDATA 1 – Initiates a modulated output on the selected transmitter channel.

TXDATA 2 – Initiates the hopping sequence defined by the CFG HOPPING SEQ section.

CFG HOPPING SEQ – Selects the channel(s) to be included in a hopping sequence.

Orthogonal Positions:

For all radiated measurements, the FLX Handset was rotated through three orthogonal axes as required by ANSI C63.10-2013, section 5.10.1, for a hand held or body worn device.

4. Measurements Parameters

4.3. Measurement Procedure

Testing was performed in accordance with the requirements detailed in ANSI C63.10-2013, American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices. In addition, FCC DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems was also referenced.

Test measurements were made in accordance with FCC Part 15.247, ANSI C63.10-2013 and IC RSS-210 Annex II: Operation within the bands 902 - 928 MHz, 2400 - 2483.5 MHz, 5725 - 5875 MHz, and 24.0 - 24.25 GHz.

The test methods used to generate the data in this test report is in accordance with ANSI C63.10-2013, American National Standard for Testing Unlicensed Wireless Devices.

In accordance with ANSI C63.10-2013, section 5.10.1 and 6.4.6, the device under test was rotated through three orthogonal axes to determine which attitude produced the highest emission relative to the limit. The positions tested were the following:

- X-axis - FLX Handset on left side, front facing antenna at 0° azimuth.
- Y-axis - FLX Handset top edge facing up, front facing antenna at 0° azimuth.
- Z-axis - FLX Handset front facing up, bottom edge facing antenna at 0° azimuth.

Y-Axis

Z-Axis

All measurements detailed in this test report represent the orthogonal position that produced the highest emission relative to a given limit.

In accordance with ANSI C63.10, section 5.6.2.2, the worst-case operating modes were investigated and used for the measurements detailed in this test report.

6. Measurement Data

6.1. Antenna Requirement (15.203, RSS-GEN 7.1.2)

Requirement: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section.

Status: The device under test utilized an internal antenna, inaccessible to the user.

Test Number: 461-14

Issue Date: 1/9/2015

6. Measurement Data (continued)

6.2. Number of Hopping Channels (15.247 (a) (1) (iii), RSS-210 A8.1 (d))

Requirement: Frequency hopping systems in the 2400–2483.5 MHz band shall use at least 15 channels.

Status: The device under test utilizes 79 hopping channels from 2402 MHz to 2480 MHz.

Result: Compliant

6. Measurement Data

6.3. Minimum 20 dB Bandwidth (15.247 (a) (1), RSS-210 A8.1 (b))

Requirement: Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

The nominal IF filter bandwidth (3 dB RBW) should be approximately 1% to 5% of the OBW, unless otherwise specified, depending on the applicable requirement.

Test Note: The 20 dB bandwidth of the hopping channel is the greater of the values.

6. Measurement Data

6.5. Average Time of Occupancy (15.247 (a) (1) (iii), RSS-210 A8.1 (d))

Requirement: The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

Test Note: A sweep time of 8 seconds was used to facilitate counting the pulses on a given frequency. This number was multiplied by 4 to determine the number of pulses in a 32 second interval.

$$79 \text{ Channels} \times 0.4 \text{ Seconds} = \sim 32 \text{ Seconds}$$

6. Measurement Data

6.7. Band Edge (15.247 (d), RSS-210 A8.5)

Requirement: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits.

Test Note: For the two upper band edge measurements, the worst case orthogonal position was first determined. This position was then used to make the measurements.

Test Procedure

Test measurements were made in accordance with ANSI C63.10-2003, Standard Methods of Measurement of Radio Noise Emissions from Low-Voltage Electrical and Electronics Equipment in the Range of 9 kHz to 40 GHz.

Test Notes:

1. The host PC that was required to control the DUT had to be co-located with the DUT during spurious radiated emissions testing. To determine if the device under test was the source of any observed emissions, at the end of each test the host PC was observed with the DUT disconnected.
2. The frequency span that includes the Bluetooth transmitters was omitted from the spurious emissions scan.
3. Refer to Appendix A for detailed screen captures of the spurious emissions..

Conclusion:

The device under test met the spurious emissions requirements.

6. Measurement Data (continued)**6.11 Conducted Emissions**

Requirement: For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal.

Test Note: The FLX Handset cannot be charged directly. The FLX handset was placed in an FLX Base Station for charging. The power line of the FLX Base Station was tested for this report

Test Results: The DUT is meets the FCC Part 15.207 requirements for conducted emissions in the tested configuration.

Regulatory Limit: FCC Part 15.207

Frequency Range (MHz)	Limits (dB μ V)	
	Quasi-Peak	Average
0.15 to 0.50	66 to 56 ¹	56 to 46 ¹
0.50 to 5.0	56	46
0.50 to 30	60	50
¹ The limit decreases linearly with the logarithm of the frequency.		

Test Procedure

Test measurements were made in accordance with CISPR 22, Section 9: Method of measurement of conducted disturbance at mains terminals and telecommunication ports and ANSI C63.10-2013, American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices.

6. Measurement Data (continued)

6.12. Public Exposure to Radio Frequency Energy Levels (1.1307 (b)(1))

6.12.1. SAR Test Exclusion Calculation

Requirement: Portable devices as defined in § 2.1093 of this chapter operating under Part 15 are subject to radio frequency radiation exposure requirements as specified in §§ 1.1307(b) and 2.1093 of this chapter.
For a 1-g SAR, the test exclusion result must be ≤ 3.0 .

Test Notes: The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by the following formula:

$$\text{SAR Test Exclusion} = \frac{P_{\text{MAX}}}{d_{\text{MIN}}} \times \sqrt{f_{(\text{GHz})}} \quad (1)$$

P_{MAX} mW Maximum power of channel, including tune-up tolerance

d_{MIN} mm Minimum test separation distance, mm (≤ 50 mm)

$f_{(\text{GHz})}$ GHz $f_{(\text{GHz})}$ is the RF channel transmit frequency in GHz (>100 MHz and <6 GHz)

(1) FCC OET 447498 - Mobile and Portable Devices RF Exposure Procedures and Equipment Authorization Policies.

Results: The device under test meets the exclusion requirement detailed in FCC OET 447498.

Input: P_{MAX}^1 (mW)	1.44544	1.72982	1.40281
d_{MIN} (mm)	5.00	5.00	5.00
$f_{(\text{GHz})}$	2.402	2.441	2.480
Test Exclusion:	0.44804	0.54052	0.44183
Limit Exemption:	3.00	3.00	3.00

¹ Taken from the peak data in Section 6.6 of this test report (converted to mW).

The device does not exceed the test limit exemption and therefore a routine SAR Evaluation is not required

7. Test Site Description

Compliance Worldwide is located at 357 Main Street in Sandown, New Hampshire. The test sites at Compliance Worldwide are used for conducted and radiated emissions testing in accordance with Federal Communications Commission (FCC), Industry Canada, and Voluntary Control Council Interference (VCCI) standards. A description of the test sites is on file with the FCC (registration number 96392), Industry Canada (file number IC 3023A-1), and VCCI (Member number 3168), Registration numbers C-3673, G-167, R-3305 & T-1809.

Compliance Worldwide is also designated as a Phase 1 CAB under APEC-MRA (US0132) for Australia/New Zealand AS/NZS CISPR 22, Chinese-Taipei (Taiwan) BSMI CNS 13438 and Korea (RRA) KN 22.

The radiated emissions test site is a 3 and 10 meter enclosed open area test site (OATS). Personnel, support equipment and test equipment are located in the basement beneath the OATS ground plane.

The conducted emissions site is part of a 16' x 20' x 12' ferrite tile chamber and uses one of the walls for the vertical ground plane required by EN 55022.

Both sites are designed to test products or systems 1.5 meters W x 1.5 meters L x 2.0 meters H, floor standing or table top.
