SECTION 3 : Test standard information

3.1 Requirements for compliance testing defined by the FCC

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996. The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g for an uncontrolled environment and 8.0 mW/g for an occupational/controlled environment as recommended by the ANSI/IEEE standard C95.1-1992. According to the Supplement C of OET Bulletin 65 "Evaluating Compliance with FCC Guide-lines for Human Exposure to Radio frequency Electromagnetic Fields", released on Jun 29, 2001 by the FCC, the device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling.

1 Specific Absorption Rate (SAR) is a measure of the rate of energy absorption due to exposure to an RF transmitting source (wireless portable device).

2 IEEE/ANSI Std. C95.1-1992 limits are used to determine compliance with FCC ET Docket 93-62.

3.2 Exposure limit

(A) Limits for Occupational/Controlled Exposure (W/kg)

Spatial Average (averaged over the whole body)	Spatial Peak (averaged over any 1g of tissue)	Spatial Peak (hands/wrists/feet/ankles averaged over 10g)
0.4	8.0	20.0

(B) Limits for General population/Uncontrolled Exposure (W/kg)

Spatial Average (averaged over the whole body)	Spatial Peak (averaged over any 1g of tissue)	Spatial Peak (hands/wrists/feet/ankles averaged over 10g)
0.08	1.6	4.0

Occupational/Controlled Environments: are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

General Population/Uncontrolled Environments: are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

**NOTE:GENERAL POPULATION/UNCONTROLLED EXPOSURE

SECTION 5 : Operation of E.U.T. during testing

5.1 Operating modes

Operation mode	The frequency band and the modulation used in this test are shown as a following. Frequency band : 2412-2462MHz Channel : Low ch(2412MHz), Mid ch(2437MHz), High ch(2462MHz) Modulation : DSSS Crest factor : 1
----------------	---

5.2 Measurement procedure

1. Confirmation before testing

Conducted power was measured before SAR testing.

Variation between the measured power level and one of EMC Test was within 0~+5%. (FCC requirements)

However, the data of EMC test is used as a substitute for SAR test when there is no possibility in power change obviously as follows:

- EMC and SAR tests are performed with the same test sample under the same condition.
- EMC and SAR tests are performed at the same laboratory.
- The test mode setting is simple, and there is no possibility that the power (value) is changed by the wrong setting.

2. SAR Measurement (Radiated power is always monitored by Spectrum Analyzer.)

Step1. Worst position search

The frequency was set to Mid Channel, and the position that has the maximum SAR value was detected.

Step2. Change channels

Test was performed using Low/High channels at the position of the maximum value.

Step3. Change separations

The measurement was performed with the distance, 5mm, 10mm and 15mm to check if the shortest distance (0mm) may not have the worst value at the conditions of the highest SAR value. As a result, the shortest distance (0mm) had the worst value

*It is checked that the power drift value at each measurement is within $\pm 5\%$ as to the power change before and after the SAR test. When the power drift value is over $\pm 5\%$, the power changes against time is measured to confirm the changes are within tolerance.

Moreover, the change rate is reflected on the uncertainty.

5.4 Test setup of EUT

We tested the Handy Terminal (Model No. : PI-13500-W) with which this EUT was inserted.

When users operate or carry the EUT, it could be considered to touch or get close to their bodies. In order to assume this situation, we performed the test at the following positions. Please refer to "APPENDIX 1" for more details.

(1) Front:

The test was performed in touch with Front surface of the Handy Terminal to the flat section of SAM Twin Phantom.

(2) Back:

The test was performed in touch with Back surface of the Handy Terminal to the flat section of SAM Twin Phantom.

(3) Left Side:

The test was performed in touch with Left Side surface of the Handy Terminal to the flat section of SAM Twin Phantom.

(4) Right Side:

The test was performed in touch with Right Side surface of the Handy Terminal to the flat section of SAM Twin Phantom.

(5) Top:

The test was performed in touch with Top surface of the Handy Terminal to the flat section of SAM Twin Phantom.

(6) Bottom:

The test was performed in touch with Bottom surface of the Handy Terminal to the flat section of SAM Twin Phantom.

(7) Top (Separation 5mm, 10mm, 15mm):

The test was performed in the separation of 5mm, 10mm, 15mm between EUT and flat sections of the SAM Twin Phantom
