I want to: Prevent ARP spoofing and ARP attacks.

How can I do that?

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > Security > IP & MAC Binding.

3. Enable ARP Binding.

4. Bind your device(s) according to your need.

   To bind the connected device(s):
   Click to add the corresponding device to the Binding List.

   To bind the unconnected device
   1) Click Add in the Binding List section.

      2) Enter the MAC address and IP address that you want to bind. Enter a Description for this binding entry.

      3) Check the box for Enable This Entry and click OK.

Done! Now you don't need to worry about ARP spoofing and ARP attacks!
Chapter 11

NAT Forwarding

The router’s NAT (Network Address Translation) feature makes devices on the LAN use the same public IP address to communicate with devices on the internet, which protects the local network by hiding IP addresses of the devices. However, it also brings about the problem that an external host cannot initiatively communicate with a specified device on the local network.

With the forwarding feature the router can penetrate the isolation of NAT and allows devices on the internet to initiatively communicate with devices on the local network, thus realizing some special functions.

The TP-Link router supports four forwarding rules. If two or more rules are set, the priority of implementation from high to low is Virtual Servers, Port Triggering, UPNP and DMZ.

It contains the following sections:

- Share Local Resources on the Internet by Virtual Servers
- Open Ports Dynamically by Port Triggering
- Make Applications Free from Port Restriction by DMZ
- Make Xbox Online Games Run Smoothly by UPnP
11. 1. **Share Local Resources on the Internet by Virtual Servers**

When you build up a server on the local network and want to share it on the internet, Virtual Servers can realize the service and provide it to internet users. At the same time Virtual Servers can keep the local network safe as other services are still invisible from the internet.

Virtual Servers can be used for setting up public services on your local network, such as HTTP, FTP, DNS, POP3/SMTP and Telnet. Different services use different service ports. Port 80 is used in HTTP service, port 21 in FTP service, port 25 in SMTP service and port 110 in POP3 service. Please verify the service port number before the configuration.

**I want to:** Share my personal website I’ve built in local network with my friends through the internet.

*For example,* the personal website has been built on my home PC (192.168.0.100). I hope that my friends on the internet can visit my website in some way. The PC is connected to the router with the WAN IP address 218.18.232.154.

**How can I do that?**

1. Assign a static IP address to your PC, for example 192.168.0.100.

2. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

3. Go to Advanced > NAT Forwarding > Virtual Servers.

4. Click Add. Click View Existing Services and select HTTP. The External Port, Internal Port and Protocol will be automatically filled in. Enter the PC’s IP address 192.168.0.100 in the Internal IP field.

5. Click OK.
Tips:
- It is recommended to keep the default settings of Internal Port and Protocol if you are not clear about which port and protocol to use.
- If the service you want to use is not in the Service Type, you can enter the corresponding parameters manually. You should verify the port number that the service needs.
- You can add multiple virtual server rules if you want to provide several services in a router. Please note that the External Port should not be overlapped.

Users on the internet can enter http:// WAN IP (in this example: http:// 218.18.232.154) to visit your personal website.

Tips:
- The WAN IP should be a public IP address. For the WAN IP is assigned dynamically by the ISP, it is recommended to apply and register a domain name for the WAN referring to Set Up a Dynamic DNS Service Account. Then users on the internet can use http:// domain name to visit the website.
- If you have changed the default External Port, you should use http:// WAN IP: External Port or http:// domain name: External Port to visit the website.

11.2. Open Ports Dynamically by Port Triggering

Port Triggering can specify a triggering port and its corresponding external ports. When a host on the local network initiates a connection to the triggering port, all the external ports will be opened for subsequent connections. The router can record the IP address of the host. When the data from the internet return to the external ports, the router can forward them to the corresponding host. Port Triggering is mainly applied to online games, VoIPs, video players and common applications including MSN Gaming Zone, Dialpad and Quick Time 4 players, etc.

Follow the steps below to configure the Port Triggering rules:

1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > NAT Forwarding > Port Triggering and click Add.
3. Click View Existing Applications, and select the desired application. The Triggering Port, External Port and Protocol will be automatically filled in. The following picture takes application MSN Gaming Zone as an example.

4. Click OK.

![Port Triggering](image)

Tips:

- You can add multiple port triggering rules according to your network need.
- The triggering ports cannot be overlapped.
- If the application you need is not listed in the Existing Applications list, please enter the parameters manually. You should verify the external ports the application uses first and enter them into External Port field according to the format the page displays.

11.3. Make Applications Free from Port Restriction by DMZ

When a PC is set to be a DMZ (Demilitarized Zone) host on the local network, it is totally exposed to the internet, which can realize the unlimited bidirectional communication between internal hosts and external hosts. The DMZ host becomes a virtual server with all ports opened. When you are not clear about which ports to open in some special applications, such as IP camera and database software, you can set the PC to be a DMZ host.
Note:
When DMZ is enabled, the DMZ host is totally exposed to the internet, which may bring some potential safety hazards. If DMZ is not in use, please disable it in time.

I want to: Make the home PC join the internet online game without port restriction.

For example, due to some port restriction, when playing the online games, you can login normally but cannot join a team with other players. To solve this problem, set your PC as a DMZ host with all ports open.

How can I do that?

1. Assign a static IP address to your PC, for example 192.168.0.100.
2. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.
3. Go to Advanced > NAT Forwarding > DMZ and select Enable DMZ.
4. Enter the IP address 192.168.0.100 in the DMZ Host IP Address field.
5. Click Save.

Done! The configuration is completed. You’ve set your PC to a DMZ host and now you can make a team to game with other players.

11.4. Make Xbox Online Games Run Smoothly by UPnP

The UPnP (Universal Plug and Play) protocol allows applications or host devices to automatically find the front-end NAT device and send request to it to open the corresponding ports. With UPnP enabled, the applications or host devices on the local network and the internet can freely communicate with each other thus realizing the seamless connection of the network. You may need to enable the UPnP if you want to use applications for multiplayer gaming, peer-to-peer connections, real-time communication (such as VoIP or telephone conference) or remote assistance, etc.
Tips:
• UPnP is enabled by default in this router.
• Only the application supporting UPnP protocol can use this feature.
• UPnP feature needs the support of operating system (e.g. Windows Vista/ Windows 7/ Windows 8, etc. Some of operating system need to install the UPnP components).

For example, when you connect your Xbox to the router which has connected to the internet to play online games, UPnP will send request to the router to open the corresponding ports allowing the following data penetrating the NAT to transmit. Therefore, you can play Xbox online games without a hitch.

If necessary, you can follow the steps to change the status of UPnP.
1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.
2. Go to Advanced > NAT Forwarding > UPnP and toggle on or off according to your needs.
Chapter 12

VPN Server

The VPN (Virtual Private Networking) Server allows you to access your home network in a secured way through internet when you are out of home. The router offers two ways to setup VPN connection: OpenVPN and PPTP (Point to Point Tunneling Protocol) VPN. OpenVPN is somewhat complex but with greater security and more stable. It is suitable for restricted environment, such as campus network and company intranet. PPTP VPN is more easily used and its speed is faster, it's compatible with most operating systems and also supports mobile devices. Its security is poor and your packets may be cracked easily, and PPTP VPN connection may be prevented by some ISP.

It contains the following sections, please choose the appropriate VPN server connection type as needed.

- Use OpenVPN to Access Your Home Network
- Use PPTP VPN to Access Your Home Network
12. 1. Use OpenVPN to Access Your Home Network

In the OpenVPN connection, the home network can act as a server, and the remote device can access the server through the router which acts as an OpenVPN Server gateway. To use the VPN feature, you should enable OpenVPN Server on your router, and install and run VPN client software on the remote device. Please follow the steps below to set up an OpenVPN connection.

12. 1. 1. Step 1. Set up OpenVPN Server on Your Router

1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > VPN Server > OpenVPN, and select Enable VPN Server.

3. Select the Service Type (communication protocol) for OpenVPN Server: UDP, TCP.

4. Enter a VPN Service Port to which a VPN device connects, and the port number should be between 1024 and 65535.

5. In the VPN Subnet/Netmask fields, enter the range of IP addresses that can be leased to the device by the OpenVPN server.
6. Select your Client Access type. Select Home Network Only if you only want the remote device to access your home network; select Internet and Home Network if you also want the remote device to access internet through the VPN Server.

7. Click Save.

8. Click Generate to get a new certificate.

![Certificate](image)

**Note:**
If you have already generated one, please skip this step, or click Generate to update the certificate.

9. Click Export to save the OpenVPN configuration file which will be used by the remote device to access your router.

![Configuration File](image)

12.1.2. Step 2. Configure OpenVPN Connection on Your Remote Device

1. Visit [http://openvpn.net/index.php/download/community-downloads.html](http://openvpn.net/index.php/download/community-downloads.html) to download the OpenVPN software, and install it on your device where you want to run the OpenVPN client utility.

**Note:**
You need to install the OpenVPN client utility on each device that you plan to apply the VPN function to access your router. Mobile devices should download a third-party app from Google Play or Apple App Store.

2. After the installation, copy the file exported from your router to the OpenVPN client utility’s “config” folder (for example, `C:\Program Files\OpenVPN\config` on Windows). The path depends on where the OpenVPN client utility is installed.

3. Run the OpenVPN client utility and connect it to OpenVPN Server.

12.2. Use PPTP VPN to Access Your Home Network

PPTP VPN Server is used to create a VPN connection for remote device. To use the VPN feature, you should enable PPTP VPN Server on your router, and configure the PPTP connection on the remote device. Please follow the steps below to set up a PPTP VPN connection.
12.2.1. Step 1. Set up PPTP VPN Server on Your Router

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > VPN Server > PPTP VPN, and select Enable VPN Server.

3. In the Client IP Address filed, enter the range of IP addresses (up to 10) that can be leased to the devices by the PPTP VPN server.

4. Click Advanced to set the PPTP connection permission according to your needs.
   - Select Allow Samba (Network Place) access to allow your VPN device to access your local Samba server.
   - Select Allow NetBIOS passthrough to allow your VPN device to access your Samba server using NetBIOS name.
   - Select Allow Unencrypted connections to allow unencrypted connections to your VPN server.

5. Click Save.

6. Configure the PPTP VPN connection account for the remote device, you can create up to 16 accounts.
1) Click Add.

2) Enter the Username and Password to authenticate devices to the PPTP VPN Server.

3) Click OK.

12.2.2. Step 2. Configure PPTP VPN Connection on Your Remote Device

The remote device can use the Windows built-in PPTP software or a third-party PPTP software to connect to PPTP Server. Here we use the Windows built-in PPTP software as an example.

1. Go to Start > Control Panel > Network and Internet > Network and Sharing Center.
2. Select Set up a new connection or network.
3. Select **Connect to a workplace** and click **Next**.

4. Select **Use my Internet connection (VPN)**.
5. Enter the internet IP address of the router (for example: 218.18.1.73) in the *Internet address* field. Click *Next*.

6. Enter the *User name* and *Password* you have set for the PPTP VPN server on your router, and click *Connect*. 
7. The PPTP VPN connection is created and ready to use.
Chapter 13

Customize Your Network Settings

This chapter guides you on how to configure advanced network features. It contains the following sections:

- Change the LAN Settings
- Configure to Support IPTV Service
- Specify DHCP Server Settings
- Set Up a Dynamic DNS Service Account
- Create Static Routes
- Specify Wireless Settings
- Use WPS for Wireless Connection
13. 1. **Change the LAN Settings**

The router is preset with a default LAN IP 192.168.0.1, which you can use to log in to its web management page. The LAN IP address together with the Subnet Mask also defines the subnet that the connected devices are on. If the IP address conflicts with another device on your local network or your network requires a specific IP subnet, you can change it.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.
2. Go to Advanced > Network > LAN.
3. Type in a new IP Address appropriate to your needs. And leave the Subnet Mask as the default settings.

![LAN Settings](image)

4. Click **Save**.

**Note:**
If you have set the Virtual Server, DMZ or DHCP address reservation, and the new LAN IP address is not in the same subnet with the old one, then you should reconfigure these features.

13. 2. **Configure to Support IPTV Service**

**I want to:**
Configure IPTV setup to enable Internet/IPTV/Phone service provided by my internet service provider (ISP).

**How can I do that?**
1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.
2. Go to Advanced > Network > IPTV.
3. If your ISP provides the networking service based on IGMP technology, e.g., British Telecom(BT) and Talk Talk in UK:
   1) Check the box for **IGMP Proxy** and select the **IGMP Version**, either V2 or V3, as required by your ISP.
Chapter 13
Customize Your Network Settings

2) Click Save.

3) After configuring IGMP proxy, IPTV can work behind your router now. You can connect your set-top box to any of the router’s Ethernet port.

If IGMP is not the technology your ISP applies to provide IPTV service:

1) Tick Enable IPTV.

2) Select the appropriate Mode according to your ISP.
   - Select Bridge if your ISP is not listed and no other parameters are required.
   - Select Custom if your ISP is not listed but provides necessary parameters.

3) After you have selected a mode, the necessary parameters, including the LAN port for IPTV connection, are predetermined. If not, select the LAN type to determine which port is used to support IPTV service.

4) Click Save.

5) Connect the set-top box to the corresponding LAN port which is predetermined or you have specified in Step 3.

Done!
Your IPTV setup is done now! You may need to configure your set-top box before enjoying your TV.

Tips:
Qos and IPTV cannot be enabled at the same time.
Chapter 13

Customize Your Network Settings

13. 3. Specify DHCP Server Settings

By default, the DHCP (Dynamic Host Configuration Protocol) Server is enabled and the router acts as a DHCP server; it dynamically assigns TCP/IP parameters to client devices from the IP Address Pool. You can change the settings of the DHCP Server if necessary, and you can reserve LAN IP addresses for specified client devices.

1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > Network > DHCP Server.

➢ To specify the IP address that the router assigns:

   1. Check the box for Enable DHCP Server.
   2. Enter the starting and ending IP addresses in the IP Address Pool.
   3. Enter other parameters if the ISP offers. The Default Gateway is automatically filled in and is the same as the LAN IP address of the router.
   4. Click Save.

➢ To reserve an IP address for a specified client device:

   1. Click Add in the Address Reservation section.
2. Click View Exsiting Devices or enter the MAC address of the client device.
3. Enter the IP address to reserve for the client device.
4. Enter the Description for this entry.
5. Check the box for Enable This Entry and click OK.

13. 4. Set Up a Dynamic DNS Service Account

Most ISPs assign a dynamic IP address to the router and you can use this IP address to access your router remotely. However, the IP address can change from time to time and you don’t know when it changes. In this case, you might apply the DDNS (Dynamic Domain Name Server) feature on the router to allow you and your friends to access your router and local servers (FTP, HTTP, etc.) using a domain name without checking and remembering the IP address.

Note:
DDNS does not work if the ISP assigns a private WAN IP address (such as 192.168.1.x) to the router.

To set up DDNS, please follow the instructions below:
1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.
2. Go to Advanced > Network > Dynamic DNS.
3. Select the DDNS Service Provider (TP-Link, NO-IP or DynDNS). It is recommended to select TP-Link so that you can enjoy TP-Link's superior DDNS service. Otherwise, please select NO-IP or DynDNS. If you don’t have a DDNS account, you have to register first by clicking Go to register.
### Dynamic DNS

**Service Provider:**
- TP-Link
- NO-IP
- DynDNS

**Current Domain Name:** ---

### Domain Name List

<table>
<thead>
<tr>
<th>Domain Name</th>
<th>Registered Date</th>
<th>Status</th>
<th>Operation</th>
<th>Modify</th>
</tr>
</thead>
<tbody>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
</tbody>
</table>

**Note:**
To enjoy TP-Link’s DDNS service, you have to log in with a TP-Link ID. If you have not logged in with one, click **Log in**.

4. Click **Register** in the Domain Name List if you have chosen TP-Link, and enter the **Domain Name** as needed.

**Note:**
To use our superior TP-LINK DDNS service, please **Log in** with your TP-LINK Cloud account, or choose another service provider.

If you have chosen NO-IP or DynDNS, enter the username, password and domain name of your account.
Chapter 13

Customize Your Network Settings

5. Click **Login and Save**.

**Tips:**
If you want to use a new DDNS account, please **logout** first, and then log in with a new account.

13. 5. **Create Static Routes**

Static routing is a form of routing that is configured manually by a network administrator or a user by adding entries into a routing table. The manually-configured routing information guides the router in forwarding data packets to the specific destination.

**I want to:**
Visit multiple networks and servers at the same time.

**For example,** in a small office, my PC can surf the internet through Router A, but I also want to visit my company’s network. Now I have a switch and Router B. I connect the devices as shown in the following figure so that the physical connection between my PC and my company’s server is established. To surf the internet and visit my company’s network at the same time, I need to configure the static routing.
Chapter 13
Customize Your Network Settings

How can I do that?

1. Change the routers’ LAN IP addresses to two different IP addresses on the same subnet. Disable Router B's DHCP function.

2. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for Router A.

3. Go to Network > Advanced Routing.

4. Click Add and finish the settings according to the following explanations:

   ![Static Routing Configuration](image)

   **Network Destination**: The destination IP address that you want to assign to a static route. This IP address cannot be on the same subnet with the WAN IP or LAN IP of Router A. In the example, the IP address of the company network is the destination IP address, so here enter 172.30.30.1.

   **Subnet Mask**: Determines the destination network with the destination IP address. If the destination is a single IP address, enter 255.255.255.255; otherwise, enter the subnet mask of the corresponding network IP. In the example, the destination network is a single IP, so here enter 255.255.255.255.

   **Default Gateway**: The IP address of the gateway device to which the data packets will be sent. This IP address must be on the same subnet with the router’s IP which sends out data. In the example, the data packets will be sent to the LAN port of Router B and then to the Server, so the default gateway should be 192.168.0.2.

   **Interface**: Determined by the port (WAN/LAN) that sends out
data packets. In the example, the data are sent to the gateway through the LAN port of Router A, so LAN should be selected.

**Description:** Enter a description for this static routing entry.

5. Click **OK**.

6. Check the **System Routing Table** below. If you can find the entry you’ve set, the static routing is set successfully.

```
System Routing Table

<table>
<thead>
<tr>
<th>ID</th>
<th>Network Destination</th>
<th>Subnet Mask</th>
<th>Gateway</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>192.168.0.0</td>
<td>255.255.255.0</td>
<td>0.0.0.0</td>
<td>lan</td>
</tr>
</tbody>
</table>
```

**Done!** Open a web browser on your PC. Enter the company server’s IP address to visit the company network.

### 13.6. Specify Wireless Settings

The router’s wireless network name (SSID) and password, and security option are preset in the factory. The preset SSID and password can be found on the label of the router. You can customize the wireless settings according to your needs.

Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

- **To enable or disable the wireless function:**
  1. Go to **Basic > Wireless**.
  2. The wireless radio is enabled by default. If you want to disable the wireless function of the router, just uncheck the box for **Enable Wireless Radio**. In this case, all the wireless settings will be invalid.

- **To change the wireless network name (SSID) and wireless password:**
  1. Go to **Basic > Wireless**.
  2. Create a new SSID in **Network Name (SSID)** and customize the password for the network in **Password**. The value is case-sensitive.

  **Note:**
  If you change the wireless settings with a wireless device, you will be disconnected when the settings are effective. Please write down the new SSID and password for future use.

- **To hide SSID:**
  1. Go to **Basic > Wireless**.
2. Select *Hide SSID*, and your SSID won’t display when you scan for local wireless networks on your wireless device and you need to manually join the network.

➢ *To change the security option:*
1. Go to *Advanced > Wireless > Wireless Settings.*
2. Select the wireless network *2.4GHz* or *5GHz.*
3. Select an option from the *Security* drop-down list. We recommend you don’t change the default settings unless necessary. If you select other options, configure the related parameters according to the help page.

**In addition**
- **Mode** - Select a transmission mode according to your wireless client devices. It is recommended to just leave it as default.
- **Channel Width** - Select a channel width (bandwidth) for the wireless network.
- **Channel** - Select an operating channel for the wireless network. It is recommended to leave the channel to *Auto*, if you are not experiencing the intermittent wireless connection issue.
- **Transmit Power** - Select either *High, Middle* or *Low* to specify the data transmit power. The default and recommended setting is *High.*

### 13.7. Use WPS for Wireless Connection

Wi-Fi Protected Setup (WPS) provides an easier approach to set up a security-protected Wi-Fi connection.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.
2. Go to *Advanced > Wireless > WPS.*

#### 13.7.1. Set the Router’s PIN

Router’s PIN is enabled by default to allow wireless devices to connect to the router using the PIN. You can use the default one or generate a new one.

<table>
<thead>
<tr>
<th>Router’s PIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIN: 35498841</td>
</tr>
</tbody>
</table>

**Note:**
- If you want to enable/disable the WPS feature, go to *System Tools > System Parameters > WPS*, check or uncheck the box for *Enable WPS.*
PIN (Personal Identification Number) is an eight-character identification number preset to each router. WPS supported devices can connect to your router with the PIN. The default PIN is printed on the label of the router.

13. 7. 2. Use the WPS Wizard for Wi-Fi Connections

1. Select a setup method:
   - **Push Button (Recommended):** Click Connect on the screen. Within two minutes, press the WPS button on the client device.
   - **PIN:** Enter the client’s PIN, and click Connect.

2. **Success** will appear on the above screen and the WPS LED on the router will keep on for five minutes if the client has been successfully added to the network.
Chapter 14

Manage the Router

This chapter will show you the configuration for managing and maintaining your router. It contains the following sections:

- Set Up System Time
- Control LEDs
- Test the Network Connectivity
- Upgrade the Firmware
- Backup and Restore Configuration Settings
- Change the Administrator Account
- Password Recovery
- Local Management
- Remote Management
- System Log
- Monitor the Internet Traffic Statistics
14.1. **Set Up System Time**

System time is the time displayed while the router is running. The system time you configure here will be used for other time-based functions like Parental Controls. You can choose the way to obtain the system time as needed.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Go to **Advanced > System Tools > Time Settings.**

   - **To get time from the Internet:**
     1. In the **Set Time** field, select **Get automatically from the Internet**.

     ![Time Settings](image)

     2. Select your local **Time Zone** from the drop-down list.
     3. In the **NTP Server I** field, enter the IP address or domain name of your desired NTP Server.
     4. (Optional) In the **NTP Server II** field, enter the IP address or domain name of the second NTP Server.
     5. Click **Obtain** to get the current Internet time and click **Save**.

   - **To manually set the date and time:**
     1. In the **Set Time** field, select **Manually**.
2. Set the current **Date** (in MM/DD/YYYY format).
3. Set the current **Time** (in HH/MM/SS format).
4. Click **Save**.

➢ **To set up Daylight Saving Time:**
1. Select **Enable Daylight Saving Time**.

2. Select the correct **Start** date and time when daylight saving time starts at your local time zone.
3. Select the correct **End** date and time when daylight saving time ends at your local time zone.
4. Click **Save**.

### 14.2. Control LEDs

The router’s LEDs indicate router’s activities and status. You can turn on or turn off the LEDs either from the web management page or by pressing the LED button.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.
2. Go to **Advanced > System Tools > System Parameters**.
3. In the **LED Control** section, check the box for **Enable Night Mode**.
4. Specify a time period in the Night Mode Period as needed, and the LEDs will be off during this period.

![LED Control](image)

5. Click Save.

14.3. Test the Network Connectivity

Diagnostics is used to test the connectivity between the router and the host or other network devices.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > System Tools > Diagnostics.

![Diagnostics](image)

3. Enter the information with the help of page tips:
   1) Choose Ping or Traceroute as the diagnostic tool to test the connectivity;
      - Ping is used to test the connectivity between the router and the tested host, and measure the round-trip time.
      - Traceroute is used to display the route (path) your router has passed to reach the tested host, and measure transit delays of packets across an Internet Protocol network.
      2) Enter the IP Address or Domain Name of the tested host.

4. Click Start to begin the diagnostics.

Tips: Click Advanced, you can modify the ping count, ping packet size or the Traceroute Max TTL. It's recommended to keep the default value.

The figure below indicates the proper connection between the router and the Yahoo server (www.Yahoo.com) tested through Ping.
Chapter 14  Manage the Router

The figure below indicates the proper connection between the router and the Yahoo server (www.Yahoo.com) tested through Traceroute.

14. 4.  Upgrade the Firmware

TP-Link aims at providing better network experience for users.

We will inform you thought the web management page if there’s any update firmware available for your router. Also, the latest firmware will be released at the TP-Link official website www.tp-link.com, and you can download it from the Support page for free.

Note:
• Make sure you remove all attached USB devices from the router before the firmware upgrade to prevent data loss.
• Backup your router configuration before firmware upgrade.
• Do NOT turn off the router during the firmware upgrade.

14. 4. 1.  Online Upgrade

1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2. When the latest firmware is available for your router, the update icon will display in the top-right corner of the page. Click the icon to go to the Firmware Upgrade page.

Alternatively, you can go to Advanced > System Tools > Firmware Upgrade, and click Check for upgrade to see whether the latest firmware is released.
3. Focus on the **Online Upgrade** section, and click **Upgrade**.

4. Wait a few minutes for the upgrade and reboot to complete.

   **Tips:**
   If there's a new and important firmware update for your router, you will see the notification (similar as shown below) on your computer as long as a web browser is opened. Click **Upgrade now**, and log into the web management page with the username and password you set for the router. You will see the **Firmware Upgrade** page.

14. 4. 2. **Manual Upgrade**

1. Download the latest firmware file for the router from [www.tp-link.com](http://www.tp-link.com).
2. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.
3. Go to **Advanced > System Tools > Firmware Upgrade**.
4. Focus on the Device Information section. Make sure the downloaded firmware file is matched with the **Hardware Version**.
5. Focus on the **Manual Upgrade** section. Click **Browse** to locate the downloaded new firmware file, and click **Upgrade**.
6. Wait a few minutes for the upgrade and reboot to complete.

14.4.3. **Restore Interrupted Upgrade after Power Failure**

If your router cannot start up after an upgrade interruption due to power failure, follow the steps below to restore the interrupted upgrade. Otherwise, your router cannot work again.

1. Make sure you have the latest firmware file in your computer. If not, try another way to connect your computer to the Internet and download the latest firmware file from [www.tp-link.com](http://www.tp-link.com).

2. Connect your computer to the router with an Ethernet cable.

3. Visit [192.168.0.1](http://192.168.0.1) and you will see the following upgrade page.

4. Click **Browse** and select the downloaded firmware file.

5. Click **Upgrade** and wait for a few minutes until the router completes the upgrading and restarts.

14.5. **Backup and Restore Configuration Settings**

The configuration settings are stored as a configuration file in the router. You can backup the configuration file to your computer for future use and restore the router to a previous settings from the backup file when needed. Moreover, if necessary you can erase the current settings and reset the router to the default factory settings.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Go to **Advanced > System Tools > Backup & Restore**.

➢ **To backup configuration settings:**

Click **Backup** to save a copy of the current settings to your local computer. A `.bin` file of the current settings will be stored to your computer.
To restore configuration settings:
1. Click Browse to locate the backup configuration file stored on your computer, and click Restore.

2. Wait a few minutes for the restoring and rebooting.
   - Note: During the restoring process, do not turn off or reset the router.

To reset the router incompletely:
1. Click Restore under the Factory Default Restore session.

2. Wait a few minutes for the resetting and rebooting.
   - Note:
     - During the resetting process, do not turn off the router.
     - After the resetting process, you can still use the current login password or the TP-Link ID to log in to the web management page.

To reset the router to factory default settings:
1. Click Factory Restore to reset the router.

2. Wait a few minutes for the resetting and rebooting.
   - Note:
     - During the resetting process, do not turn off or reset the router.
     - We strongly recommend you backup the current configuration settings before resetting the router.

14.6. Change the Administrator Account

The account management feature allows you to change your login password of the web management page.
Chapter 14
Manage the Router

Note:
If you are using the TP-Link ID to log in to the web management page, the account management feature will be disabled. To manage the TP-Link ID, go to Basic > TP-Link Cloud.

1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > System Tools > Administration and focus on the Account Management section.

3. Enter the old password, then a new password twice (both case-sensitive). Click Save.

4. Use the new password for future logins.

14.7. Password Recovery

This feature allows you to recover the login password you set for your router in case you forget it.

Note:
If you are using the TP-Link ID to log in to the web management page, the Password Recovery feature will be disabled. To manage the TP-Link ID, go to Basic > TP-Link Cloud.

1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > System Tools > Administration and focus on the Password Recovery section.

3. Check the box for Enable Password Recovery.

4. Specify a mailbox (From) for sending the recovery letter and enter its SMTP Server address. Specify a mailbox (To) for receiving the recovery letter. If the mailbox (From) to send the recovery letter requires encryption, select Enable Authentication and enter its username and password.

Tips:
- SMTP server is available for users in most webmail systems. For example, the SMTP server address of Gmail is smtp.gmail.com. You can refer to their Help page to learn the SMTP server address.
- Generally, Enable Authentication should be selected if the login of the mailbox requires username and password.
5. Click **Save**.

You can click **Test Email** to test whether the configuration is successful.

To recover the login password, please visit [http://tplinkwifi.net](http://tplinkwifi.net), click **Forgot Password?** on the login page and follow the instructions to set a new password.

### 14.8. Local Management

This feature allows you to limit the number of client devices on your LAN from accessing the router by using the MAC address-based authentication.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Go to **Advanced > System Tools > Administration** and complete the settings in **Local Management** section according to your needs.

- **Allow all LAN connected devices to manage the router:**
  
  Toggle on **Access for All LAN Connected Devices**.

- **Allow specific devices to manage the router:**
  
  1) Toggle off **Access for All LAN Connected Devices**.
  
  2) Click **Add**.
3) Click **View Existing Devices** and select the device to manage the router from the Existing Devices list, or enter the MAC address of the device manually.

4) Specify a **Description** for this entry.

5) Check the box for **Enable This Entry**.

6) Click **OK**.

### 14.9. Remote Management

This feature allows you to control remote devices’ authority to manage the router.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Go to **Advanced > System Tools > Administration** and complete the settings in **Remote Management** section according to your needs.
• **Forbid all devices to manage the router remotely:** Select **Disable Remote Management** and click **Save**.

• **Allow all devices to manage the router remotely:**
  1) Select **Enable Remote Management for All Devices**.
  2) Enter **Web Management Port** (1024-65535 or 80).
  3) Click **Save**.

Devices on the Internet can log in to **http://Router’s WAN IP address:port number** (such as **http://113.116.60.229:1024**) to manage the router.

**Tips:**
- You can find the WAN IP address of the router on **Basic > Network Maps > Internet**.
- The router’s WAN IP is usually a dynamic IP. Please refer to **Set Up a Dynamic DNS Service Account** if you want to log in to the router through a domain name.

• **Allow specific devices to manage the router remotely:**
  1) Select **Enable Remote Management for Specified Devices**.
  2) Enter **Web Management Port** (1024-65535 or 80).
  3) In **Remote Management IP address**, enter the IP address of the remote device to manage the router.
  4) Click **Save**.

Devices using this WAN IP can manage the router by logging in to **http://Router’s WAN IP:port number** (such as **http://113.116.60.229:1024**).

**Tips:**
The router’s WAN IP is usually a dynamic IP. Please refer to **Set Up a Dynamic DNS Service Account** if you want to log in to the router through a domain name.

### 14.10. System Log

When the router does not work properly, you can save the system log and send it to the technical support for troubleshooting.

➢ **To Save the System Log in Local:**

1. Visit **http://tplinkwifi.net**, and log in with the username and password you set for the router.
2. Go to **Advanced > System Tools > System Log**.
3. Choose the type and level of the system logs according to your need.
4. Click **Save Log** to save the system logs to local.
To Send the System Log to a Mailbox at a Fixed Time:

For example, I want to check my router’s working status at a fixed time every day, however, it’s too troublesome to log in to the web interface every time I want to go checking. It would be great if the system logs could be sent to my mailbox at 8 a.m. every day.

1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > System Tools > System Log.

3. Click Mail Settings.

4. Enter the information with the help of page tips:
1) **From**: Enter the email address used for sending the system log.

2) **To**: Enter the recipient’s email address, which can be the same as or different from the sender’s email address.

3) **SMTP Server**: Enter the SMTP server address.

   *Tips*: SMTP server is available for users in most webmail systems. For example, the SMTP server address of Hotmail is smtp-mail.outlook.com. You can refer to their Help page to learn the SMTP server address.

4) Select **Enable Authentication**.

   *Tips*: Generally, Enable Authentication should be selected if the login of the mailbox requires username and password.

5) **Username**: Enter the email address used for sending the system log.

6) **Password**: Enter the password to login the sender’s email address.

7) Select **Enable Auto Mail**.

   *Tips*: The router will send the system log to the designated email address if this option is enabled.

8) Set a fixed time. The recipient will receive the system log sent at this time every day.

5. Click **Save**.

### 14. 11. Monitor the Internet Traffic Statistics

The Traffic Statistics page displays the network traffic of the LAN, WAN and WLAN sent and received packets, allowing you to monitor the volume of Internet traffic statistics.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Go to **Advanced > System Tools > Traffic Statistics**.
3. Toggle on Traffic Statistics, and then you can monitor the traffic statistics in Traffic Statistics List section.

Click Refresh to update the statistic information on the page.
Click Reset All to reset all statistic values in the list to zero.
Click Delete All to delete all statistic information in the list.
Click  to reset the statistic information of the specific device.
Click  to delete the specific device item in the list.
FAQ

Q1. What should I do if I forget my wireless password?
The default wireless password is printed on the label of the router. If the password has been altered:
1. Connect your computer to the router using an Ethernet cable.
2. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.
3. Go to Basic > Wireless to retrieve or reset your wireless password.

Q2. What should I do if I forget my web management password?
• If you are using a TP-Link ID to log in, or you have enabled the Password Recovery feature of the router, click Forgot password on the login page and then follow the instructions to reset it.
• Alternatively, press and hold the Reset button of the router until the Power LED binks to reset it, and then visit http://tplinkwifi.net to create a new login password.

Note:
• Please refer to Password Recovery to learn how to configure Password Recovery.
• You’ll need to reconfigure the router to surf the internet once the router is reset, and please mark down your new password for future use.

Q3. What should I do if I cannot log in to the router’s web management page?
This can happen for a variety of reasons. Please try the methods below to log in again.
• Make sure your computer is connected to the router correctly and the corresponding LED indicator(s) light up.
• Make sure the IP address of your computer is configured as Obtain an IP address automatically and Obtain DNS server address automatically.
• Make sure you enter the correct IP address to login: http://tplinkwifi.net.
• Check your computer’s settings:
  1) Go to Start > Control Panel > Network and Internet, and click View network status and tasks.
  2) Click Internet Options on the bottom left.
  3) Click Connections and select Never dial a connection.
4) Click LAN settings and deselect the following three options and click OK.

5) Go to Advanced > Restore advanced settings, click OK to save the settings.
• Use another web browser or computer to log in again.
• Reset the router to factory default settings and try again. If login still fails, please contact the technical support.

  Note: You’ll need to reconfigure the router to surf the internet once the router is reset.

Q4. How to use the WDS Bridging function to extend my wireless network?

For example, my house covers a large area. The wireless coverage of the router I’m using (the root router) is limited. I want to use an extended router to extend the wireless network of the root router.

  Note:
  • WDS bridging only requires configuration on the extended router.
  • WDS bridging function can be enabled either in 2.4GHz frequency or 5GHz frequency for a dual-band router. We use the WDS bridging function in 2.4GHz frequency as example.

1. Visit [http://tplinkwifi.net](http://tplinkwifi.net), and log in with your TP-Link ID or the password you set for the router.

2. Configure the IP address of the router:

   1) Go to Advanced > Network > LAN, configure the IP address of the extended router to be in the same subnet with the root router. (For example, the IP address
of the root router is 192.168.0.1, the IP address of the extended router can be 192.168.0.2~192.168.0.254. We take 192.168.0.2 as example.)

2) Click **Save**.

*Note:* Log into the web management page again if the IP address of the router is altered.

![LAN Settings](image1)

3. Survey the SSID to be bridged:
   1) Go to **Advanced > System Tools > System Parameters** and focus on the **2.4GHz Wireless** section, click **Enable WDS Bridging**.
   2) Click **Survey**, locate the root router’s SSID and click **Choose** (Here we take *TP-Link_4F98* as example).
   3) If the root router has wireless password, you should enter the wireless password of the root router.
   4) Click **Save**.

![WDS Bridging](image2)

4. Disable DHCP:
   1) Go to **Network > DHCP Server**.
   2) Deselect **Enable DHCP Server** and click **Save**.

Now you can go to **Advanced > Status > Wireless** to check the WDS status. When the **WDS status** is **Run**, it means WDS bridging is successfully built.

Q5. **What should I do if I cannot access the internet even though the**
configuration is finished?

1. Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2. Go to Advanced > Status to check internet status:

As the follow picture shows, if IP Address is a valid one, please try the methods below and try again:

![Image of network status](image)

- Your computer might not recognize any DNS server addresses. Please manually configure the DNS server.
  1. Go to Advanced > Network > DHCP Server.
  2. Enter 8.8.8.8 as Primary DNS, click Save.

Tips: 8.8.8.8 is a safe and public DNS server operated by Google.
• Restart the modem and the router.
  1) Power off your modem and router, and leave them off for 1 minute.
  2) Power on your modem first, and wait about 2 minutes until it gets a solid cable or Internet light.
  3) Power on the router.
  4) Wait another 1 or 2 minutes and check the internet access.
• Reset the router to factory default settings and reconfigure the router.
• Upgrade the firmware of the router.
• Check the TCP/IP settings on the particular device if all other devices can get internet from the router.

As the picture below shows, if the IP Address is 0.0.0.0, please try the methods below and try again:

- Make sure the physical connection between the router and the modem is proper.
- Clone the MAC address of your computer.
  1) Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.
  2) Go to Advanced > Network > Internet and focus on the MAC Clone section.
  3) Choose an option as needed (enter the MAC address if Use Custom MAC Address is selected), and click Save.
Tips:

• Some ISP will register the MAC address of your computer when you access the internet for the first time through their Cable modem, if you add a router into your network to share your internet connection, the ISP will not accept it as the MAC address is changed, so we need to clone your computer’s MAC address to the router.

• The MAC addresses of a computer in wired connection and wireless connection are different.

• Modify the LAN IP address of the router.

Note:

Most TP-Link routers use 192.168.0.1/192.168.1.1 as their default LAN IP address, which may conflict with the IP range of your existing ADSL modem/router. If so, the router is not able to communicate with your modem and you can’t access the internet. To resolve this problem, we need to change the LAN IP address of the router to avoid such conflict, for example, 192.168.2.1.

1) Visit http://tplinkwifi.net, and log in with your TP-Link ID or the password you set for the router.

2) Go to Advanced > Network > LAN.

3) Modify the LAN IP address as the follow picture shows. Here we take 192.168.2.1 as an example.

4) Click Save.

• Restart the modem and the router.

  1) Power off your modem and router, and leave them off for 1 minute.

  2) Power on your modem first, and wait about 2 minutes until it get a solid cable or Internet light.

  3) Power on the router.

  4) Wait another 1 or 2 minutes and check the internet access.

• Double check the internet connection type.
1) Confirm your internet connection type, which can be learned from the ISP.
2) Visit \texttt{http://tplinkwifi.net}, and log in with your TP-Link ID or the password you set for the router.
3) Go to Advanced > Network > Internet.
4) Select your Internet Connection Type and fill in other parameters.
5) Click Save.

6) Restart the modem and the router again.
   - Please upgrade the firmware of the router.

If you’ve tried every method above but still cannot access the internet, please contact the technical support.

Q6. What can I do if I cannot find my wireless network or I cannot connect the wireless network?

If you fail to find any wireless network, please follow the steps below:
   - Make sure the wireless function of your device is enabled if you’re using a laptop with built-in wireless adapter. You can refer to the relevant document or contact the laptop manufacturer.
   - Make sure the wireless adapter driver is installed successfully and the wireless adapter is enabled.
     - **On Windows 7**
       1) If you see the message \texttt{No connections are available}, it is usually because the wireless function is disabled or blocked somehow.
2) Click **Troubleshoot** and windows might be able to fix the problem by itself.

- **On Windows XP**
  1) If you see the message *Windows cannot configure this wireless connection*, this is usually because windows configuration utility is disabled or you are running another wireless configuration tool to connect the wireless.
  2) Exit the wireless configuration tool (the TP-Link Utility, for example).
  3) Select and right click on **My Computer** on desktop, select **Manage** to open Computer Management window.
  4) Expand **Services and Applications > Services**, find and locate **Wireless Zero Configuration** in the Services list on the right side.
  5) Right click **Wireless Zero Configuration**, and then select **Properties**.
  6) Change **Startup type** to **Automatic**, click on Start button and make sure the Service status is **Started**. And then click **OK**.

If you can find other wireless network except your own, please follow the steps below:

- Check the WLAN LED indicator on your wireless router/modem.
- Make sure your computer/device is still in the range of your router/modem. Move it closer if it is currently too far away.
- Go to **Advanced > Wireless > Wireless Settings**, and check the wireless settings. Double check your Wireless Network Name and SSID is not hided.

![Wireless Settings](image)

If you can find your wireless network but fail to connect, please follow the steps below:

- **Authenticating problem/password mismatch:**
1) Sometimes you will be asked to type in a PIN number when you connect to the wireless network for the first time. This PIN number is different from the Wireless Password/Network Security Key, usually you can only find it on the label of your router.

![Image of Connect to a Network window]

Type the 8-digit PIN from the router display

It is not the general wireless password

PIN:

Connect using a security key instead

2) If you cannot find the PIN or PIN failed, you may choose Connecting using a security key instead, and then type in the Wireless Password/Network Security Key.

3) If it continues to show note of Network Security Key Mismatch, it is suggested to confirm the wireless password of your wireless router.

**Note:** Wireless Password/Network Security Key is case sensitive.

- **Windows unable to connect to XXXX / Can not join this network / Taking longer than usual to connect to this network:**
  - Check the wireless signal strength of your network. If it is weak (1~3 bars), please move the router closer and try again.
  - Change the wireless Channel of the router to 1, 6 or 11 to reduce interference from other networks.
  - Re-install or update the driver for your wireless adapter of the computer.
COPYRIGHT & TRADEMARKS

Specifications are subject to change without notice. tp-link is a registered trademark of TP-LINK TECHNOLOGIES CO., LTD. Other brands and product names are trademarks or registered trademarks of their respective holders.

No part of the specifications may be reproduced in any form or by any means or used to make any derivative such as translation, transformation, or adaptation without permission from TP-LINK TECHNOLOGIES CO., LTD. Copyright © 2016 TP-LINK TECHNOLOGIES CO., LTD. All rights reserved.
This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.

Note: The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment. Such modifications could void the user’s authority to operate the equipment.

**FCC RF Radiation Exposure Statement**

This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This device and its antenna must not be co-located or operating in conjunction with any other antenna or transmitter.

“To comply with FCC RF exposure compliance requirements, this grant is applicable to only Mobile Configurations. The antennas used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be co-located or operating in conjunction with any other antenna or transmitter.”

The device is restricted in indoor environment only.
For product available in the USA/Canada market, only channel 1~11 can be operated. Selection of other channels is not possible.

**CE Mark Warning**

![CE Mark](image)

This is a class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

**RF Exposure Information**

This device meets the EU requirements (1999/5/EC Article 3.1a) on the limitation of exposure of the general public to electromagnetic fields by way of health protection. The device complies with RF specifications when the device used at 20 cm from your body.

Restricted to indoor use.

**Canadian Compliance Statement**

This device complies with Industry Canada license-exempt RSS standard(s). Operation is subject to the following two conditions:

1. This device may not cause interference, and
2. This device must accept any interference, including interference that may cause undesired operation of the device.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes:

1. l'appareil ne doit pas produire de brouillage;
2. l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement

This radio transmitter (IC: 8853A-C9/ Model: Archer C9) has been approved by Industry Canada to operate with the antenna types listed below with the maximum permissible gain indicated. Antenna types not included in this list below, having a gain greater than the maximum gain indicated for that type, are strictly prohibited for use with this device.

Le présent émetteur radio (IC: 8853A-C9/ Model: Archer C9) a été approuvé par Industrie Canada pour fonctionner avec les types d’antenne énumérés ci-dessous et ayant un gain admissible maximal. Les types d’antenne non inclus dans cette liste ci-dessous et dont le gain est supérieur au gain maximal indiqué, sont strictement interdits pour l'exploitation de l'émetteur.

| Antenna | Three dual band detachable antennas, 3dBi for 5GHz and 2dBi for 2.4GHz. |
Caution:

1. The device for operation in the band 5150–5250 MHz is only for indoor use to reduce the potential for harmful interference to co-channel mobile satellite systems;

2. For devices with detachable antenna(s), the maximum antenna gain permitted for devices in the band 5745-5850 MHz shall be such that the equipment still complies with the e.i.r.p. limits specified for point-to-point and non-point-to-point operation as appropriate; and

The high-power radars are allocated as primary users (i.e. priority users) of the bands 5745-5850 MHz and that these radars could cause interference and/or damage to LELAN devices.

Avertissement:

1. Le dispositif fonctionnant dans la bande 5150-5250 MHz est réservé uniquement pour une utilisation à l’intérieur afin de réduire les risques de brouillage préjudiciable aux systèmes de satellites mobiles utilisant les mêmes canaux;

2. Le gain maximal d’antenne permis pour les dispositifs avec antenne(s) amovible(s) utilisant la bande 5745-5850 MHz doit se conformer à la limitation P.I.R.E spécifiée pour l’exploitation point à point et non point à point, selon le cas.

En outre, les utilisateurs devraient aussi être avisés que les utilisateurs de radars de haute puissance sont désignés utilisateurs principaux (c.-à-d., qu’ils ont la priorité) pour les bandes 5745-5850 MHz et que ces radars pourraient causer du brouillage et/ou des dommages aux dispositifs LAN-EL.

Radiation Exposure Statement:

This equipment complies with IC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

Déclaration d’exposition aux radiations:

Cet équipement est conforme aux limites d’exposition aux rayonnements IC établies pour un environnement non contrôlé. Cet équipement doit être installé et utilisé avec un minimum de 20 cm de distance entre la source de rayonnement et votre corps.
