1 Assessment

The following device as further described in section 3 of this report was evaluated for radiated spurious emissions in simultaneous transmission of cellular and Bluetooth radio according to criteria specified in the Code of Federal Regulations Title 47 CFR: Part 27 and Industry Canada Radio Standard Specifications RSS-130 Issue 2.

Company	Description	Model #
Philips-Respironics	Continuous Airway Pressure Device with Bluetooth Radio (BDR/EDR) and LTE CAT M cellular modem in accessory, sends and receives data.	1116426

Specifically this report shows that the product fulfills the radiated emission requirements when operating in simultaneous transmission mode, when plugged into a common host together with following radio module:

Company	Description	Model #
Philips-Respironics	LTE Cat M Modem sends and receives data on Band 13	200603C Parent & 200604C Variant

Based on client declaration, only differences in same carrier models is one is a diminutive version where parts are not stuffed to remove a USB port

No deficiencies were ascertained.

According to section 6 of this report, the overall result is PASS.

3.5 Mode of Operation details

Mode of Operation	Description of Operating modes	Additional Information
Op. 1	Cellular NB-IoT & Bluetooth	Cellular was tested on Mid Channel at the maximum power, simultaneous transmission with Bluetooth. Cellular was configured by the client to auto connect, no commands used for cellular radio configuration. "RASP Bluetooth Test Suite" software tool was provided by the customer, to configure the Bluetooth radio: ▪ Mode: BT Classic / BLE ▪ Transmit mode: TX / RX ▪ Hopping: Yes / No ▪ Hopping Type: Single Frequency / 79 Channels ▪ Channel: Low, Mid, High, Channel # 39 ▪ Packet Type: DH1, DH3, DH5, 2-DH1, 3-DH1, 3-DH3, 3-DH5 ▪ Modulation: GFSK, QPSK, 8PSK, Unmodulated "RASP Bluetooth Test Suite" will not be available to the end user. The internal antenna was connected.

3.6 Justification for Worst Case Mode of Operation

During the testing process the cellular radio was tested with transmitter sets on mid channel at the maximum power in simultaneous transmission mode with the worst case mode of Bluetooth radio.

For radiated measurements, all data in this report shows the worst case between horizontal and vertical antenna polarizations and for all orientations of the EUT.

4 Subject of Investigation

The objective of the evaluation conducted by CETECOM Inc. is to perform and check radiated spurious emissions against the limits per Code of Federal Regulations Title 47 CFR: Part 27 and Industry Canada Radio Standard Specifications RSS-130 Issue 2, in simultaneous transmission mode of (DreamStation Cellular Modem U-Blox CAT M1 Modem SARA-R410M-02B-01 FCC/IC ID: XPY2AGQN4NNN/8595A-2AGQN4NNN) and (Broadcom in DreamStation FCC/IC ID: THO1116426/3234B-1116426)

4.1 Dates of Testing:

05/09/2019 – 05/10/2019

4.2 Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus, with 95% confidence interval (in dB delta to result), based on a coverage factor k=1.

Radiated measurement

9 kHz to 30MHz	±2.5 dB (Magnetic Loop Antenna)
30 MHz to 1000 MHz	±2.0 dB (Biconilog Antenna)
1 GHz to 40 GHz	±2.3 dB (Horn Antenna)

4.3 Environmental Conditions during Testing:

The following environmental conditions were maintained during the course of testing:

- Ambient Temperature: 20-25°C
- Relative humidity: 40-60%

Deviating test conditions are indicated at individual test description where applicable.

5 Measurement Procedures

Testing is performed according to the guidelines provided in FCC publication (KDB) 971168 D01 v03 – “Measurement Guidance for Certification of Licensed Digital Transmitters” and according to ANSI C63.26 as detailed below.

5.1 Radiated Measurement

- The exploratory measurement is accomplished by running a matrix of 16 sweeps over the required frequency range with R&S Test-SW EMC32 for 360° continuous measurement of the turntable, two orthogonal positions of the EUT and both antenna polarizations. This procedure exceeds the requirement of the above standards to cover the 3 orthogonal axis of the EUT. A max peak detector is utilized during the exploratory measurement. The Test-SW creates an overall maximum trace for all 12 sweeps and saves the settings for each point of this trace. The maximum trace is part of the test report.
- The 10 highest emissions are selected with an automatic algorithm of EMC32 searching for peaks in the noise floor and ensuring that broadband signals are not selected multiple times.
- The maxima are then put through the final measurement and again maximized in a 90deg range of the turntable, fine search in frequency domain and height scan between 1m and 4m.
- The above procedure is repeated for all possible ways of power supply to EUT and for all supported modulations.
- In case there are no emissions above noise floor level only the maximum trace is reported as described above.
- The results are split up into up to 4 frequency ranges due to antenna bandwidth restrictions. A magnetic loop is used from 9 kHz to 30 MHz, a Biconilog antenna is used from 30 MHz to 1 GHz, and two different horn antennas are used to cover frequencies up to 40 GHz.

5.2 Sample Calculations for Field Strength Measurements

Field Strength is calculated from the Spectrum Analyzer/ Receiver readings, taking into account the following parameters:

- Measured reading in dB μ V
- Cable Loss between the receiving antenna and SA in dB and
- Antenna Factor in dB/m

All radiated measurement plots in this report are taken from a test SW that calculates the Field Strength based on the following equation:

$$FS \text{ (dB}\mu\text{V/m)} = \text{Measured Value on SA (dB}\mu\text{V)} - \text{Cable Loss (dB)} + \text{Antenna Factor (dB/m)}$$

Example:

Frequency (MHz)	Measured SA (dB μ V)	Cable Loss (dB)	Antenna Factor Correction (dB)	Field Strength Result (dB μ V/m)
1000	80.5	3.5	14	98.0
