

4.2 FIELD STRENGTH MEASUREMENT

4.2.1 LIMITS OF FIELD STRENGTH MEASUREMENT

The field strength of any emissions within the permitted 200kHz band shall not exceed 250 uV/meter at 3 meters.

Frequencies (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
88-108	250	3

NOTE:

Emission level (dBuV/m) = 20 log Emission level (uV/m).

4.2.2 TEST INSTRUMENTS

Device	Model No.	Serial No.	Last Cal.	Next Cal
Cable 1	8214	CBL-006	02/19/05	02/19/06
Cable 2	8268	CBL-002	02/19/05	02/19/06
ROHDE & SCHWARZ EMI Test Receiver	ESIB 40	100201	01/23/04	01/23/06
Tower 1	EMCO 1050	9310-1786	N/A	N/A

Bilog Antenna	CBL6112B	2604	09/03/04	11/04/05
Shielded Semi-Anechoic Chamber	RANTEC	N/A	02/11/05	02/11/06
Temperature and Humidity Recorder	Dickson TH8-24C	5097755	09/16/03	09/16/05

4.2.3 TEST PROCEDURES

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter semi-anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

NOTE:

1. The resolution bandwidth of test receiver/spectrum analyzer is 3 kHz, and video bandwidth is 10 kHz for Peak detection (PK) at frequency ranging from 87-109 MHz.
2. The resolution bandwidth of test receiver/spectrum analyzer is 3 kHz, and video bandwidth is 300 Hz for Average detection (AV) at frequency ranging from 87-109 MHz.
4. The EUT must be tested for three orthogonal positions which are X, Y, and Z.
5. At each frequency voltage 13.8VDC was used.

4.2.4 DEVIATION FROM TEST STANDARD

No deviation

4.2.5 TEST SETUP

Field Strength Test
EUT placed at Z position
(Front View)

4.2.6 EUT OPERATING CONDITIONS

The EUT is continuously linked with the iPod at every channel frequency. There are three channel frequencies that were tested at 88.1MHz, 99.9MHz, and 107.9MHz. During the operating condition, voltage 13.8VDC were tested. The EUT is tested for three orthogonal positions X, Y, and Z. The typical modulation was used.

This program was repeated continuously for the duration of the testing. The above mentioned set-up allowed the article to perform sufficiently for the test purposes and required time, i.e. produce radiated emissions.

4.3 BANDWIDTH MEASUREMENT

4.3.1 LIMITS OF BANDWIDTH MEASUREMENT

Emissions from the intentional radiator shall be confined within a band 200kHz wide centered on the operating frequencies. The 200kHz band shall lie wholly within the frequency range of 88-108 MHz.

The 26dBc bandwidth was measured and recorded.

4.3.2 TEST INSTRUMENT

4.3.3 TEST PROCEDURE

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter Semi-Anechoic Chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The antenna is a bilog antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

4.3.4 DEVIATION FROM TEST STANDARDS

No deviation

4.3.5 TEST SETUP

BANDWIDTH Test
EUT placed at Z position
(Front View)

4.3.6 EUT OPERATING CONDITIONS

The EUT is continuously linked with the iPod at every channel frequency. There are three channel frequencies that were tested at 88.1MHz, 99.9MHz, and 107.9MHz. During the operating condition, voltage of 13.8VDC was tested. The EUT is tested for Z orthogonal positions. The typical modulation was used.

This program was repeated continuously for the duration of the testing. The above mentioned set-up allowed the article to perform sufficiently for the test purposes and required time, i.e. produce radiated emissions.

4.4 BAND EDGES MEASUREMENT

4.4.1 LIMITS OF BAND EDGES MEASUREMENT

Emissions from the intentional radiator shall be confined within the highest field strength level of the carrier signal with –20dB below of operating band (in 3KHz Resolution Bandwidth).

For peak measurement it was set both RBW and VBW of spectrum analyzer to 3 kHz and 10 kHz with suitable frequency span. For average measurement it was set both RBW and VBW of spectrum analyzer to 3 kHz and 300 Hz with suitable frequency span. The band edges was measured from the highest field strength level of the carrier signal and subtracted from the edge of the band for frequencies 88.0 and 108.0 MHz.

4.4.3 TEST PROCEDURE

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter Semi-Anechoic Chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The antenna is a bilog antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

4.4.4 DEVIATION FROM TEST STANDARD

No deviation

4.4.5 TEST SET UP

Band Edge Test
EUT placed at Z position
(Front View)

4.4.6 EUT OPERATING CONDITION

The EUT is continuously linked with the iPod at every channel frequency. There are three channel frequencies that were tested at 88.1MHz, and 107.9MHz. During the operating condition, voltage of 13.8VDC was tested. The EUT is tested for Z orthogonal positions. The typical modulation was used. This program was repeated continuously for the duration of the testing. The above mentioned set-up allowed the article to perform sufficiently for the test purposes and required time, i.e. produce radiated emissions.

4.5.3 TEST PROCEDURES

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter Semi-Anechoic Chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
 - b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
 - c. The antenna is a Horn antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
 - d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

NOTE:

1. The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 3 kHz, 10kHz for Peak detection (PK) at frequency below 1GHz.
2. The resolution bandwidth of test receiver/spectrum analyzer is 3 kHz and the video bandwidth is 300 Hz for Average detection (AV) at frequency below 1GHz.
