Exalt Wireless - San Jose
1350 E Arapaho Rd.
Richardson, TX 75081

Dear Nader Vasseghi,

Enclosed is the EMC Wireless test report for compliance testing of the Exalt Wireless - San Jose, ExtendAir G2 24GHz (rc24020) as tested to the requirements of Title 47 of the CFR, Ch. 1 (10-1-06 ed.), FCC Part 15 Subpart C, RSS-210, Issue 8, December 2010 for Intentional Radiators.

Thank you for using the services of MET Laboratories, Inc. If you have any questions regarding these results or if MET can be of further service to you, please feel free to contact me.

Sincerely yours,
MET LABORATORIES, INC.

Jennifer Warnell
Documentation Department

Electromagnetic Compatibility Criteria Test Report

for the

**Exalt Wireless - San Jose
ExtendAir G2 24GHz (rc24020)**

Verified under
the FCC Certification Rules
contained in
Title 47 of the CFR, Part 15.249 Subpart C
&
RSS-210, Issue 8, December 2010
for Intentional Radiators

MET Report: EMCS87365-FCC249 Rev. 3

March 10, 2016

Prepared For:

**Exalt Wireless - San Jose
1350 E Arapaho Rd.
Richardson, TX 75081**

Prepared By:
MET Laboratories, Inc.
914 W. Patapsco Ave.
Baltimore, MD 21230

Electromagnetic Compatibility Criteria Test Report

for the

**Exalt Wireless - San Jose
ExtendAir G2 24GHz (rc24020)**

Tested Under
the FCC Certification Rules
contained in
Title 47 of the CFR, Part 15.249 Subpart C
&
RSS-210, Issue 8, December 2010
for Intentional Radiators

Kaushani Dasgupta, Project Engineer
Electromagnetic Compatibility Lab

Jennifer Warnell
Documentation Department

Engineering Statement: The measurements shown in this report were made in accordance with the procedures indicated, and the emissions from this equipment were found to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them. It is further stated that upon the basis of the measurements made, the equipment tested is capable of operation in accordance with the requirements of the FCC Rules Part 15.249 and Industry Canada standard RSS-210, Issue 8, December 2010 under normal use and maintenance.

Asad Bajwa, Director
Electromagnetic Compatibility Lab

Report Status Sheet

Revision	Report Date	Reason for Revision
Ø	February 26, 2016	Initial Issue.
1	March 1, 2016	Engineer corrections.
2	March 8, 2016	Editorial corrections.
3	March 10, 2016	Editorial corrections.

Table of Contents

I.	Executive Summary	1
	A. Purpose of Test	2
	B. Executive Summary	2
II.	Equipment Configuration	3
	A. Overview	4
	B. References	4
	C. Test Site	5
	D. Description of Test Sample.....	5
	E. Equipment Configuration	6
	F. Support Equipment	6
	G. Ports and Cabling Information.....	6
	H. Mode of Operation.....	7
	I. Modifications.....	7
	a) Modifications to EUT	7
	b) Modifications to Test Standard.....	7
	J. Disposition of EUT	7
III.	Electromagnetic Compatibility Criteria for Intentional Radiators.....	8
	§ 15.203 Antenna Requirement	9
	§ 15.207(a) Conducted Emissions Limits.....	10
	§ 15.249(b)(1) Radiated Fundament and Harmonics.....	14
	§ 15.247(i) Maximum Permissible Exposure	24
	§ 15.249(b)(2) Frequency Tolerance	25
	§ 15.249(b)(3) Antenna Performance	28
	§ 15.249(a)(d) Spurious Emissions	37
	§2.1049 & RSS-GEN (6.6) 99% Occupied Bandwidth.....	111
	§RSS-210 Power to Antenna	126
IV.	Test Equipment	134
V.	Certification & User's Manual Information.....	136
	A. Certification Information	137
	B. Label and User's Manual Information	141
VI.	ICES-003 Procedural & Labeling Requirements.....	143

VCP	Vertical Coupling Plane

I. Executive Summary

A. Purpose of Test

An EMC evaluation was performed to determine compliance of the Exalt Wireless – San Jose ExtendAir G2 24GHz (rc24020), with the requirements of Part 15, §15.249. All references are to the most current version of Title 47 of the Code of Federal Regulations in effect. In accordance with §2.1033, the following data is presented in support of the Certification of the ExtendAir G2 24GHz (rc24020). Exalt Wireless – San Jose should retain a copy of this document which should be kept on file for at least two years after the manufacturing of the ExtendAir G2 24GHz (rc24020), has been **permanently** discontinued.

B. Executive Summary

The following tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 15, §15.249, in accordance with Exalt Wireless – San Jose, purchase order number 109107. All tests were conducted using measurement procedure ANSI C63.4-2014.

FCC Reference	Canada Reference	Description	Results
§15.203	--	Antenna Requirement	Compliant
§15.207	RSS GEN §8.8	AC Power Line Conducted Emissions	Compliant
§15.249 (b)(1)	RSS-210 A12	Field Strength of Fundamental	Compliant
§15.249 (b)(2)	RSS-210 A12	Frequency Tolerance	Compliant
§15.249 (b)(3)	RSS-210 A12	Antenna Performance	Compliant
§15.249(a)(d), §15.209	RSS-Gen §7.2.5 and RSS-210 A2.0	Spurious Emissions	Compliant
§15.247(i)	RSS-102	Maximum Permissible Exposure	Compliant

Table 1. Executive Summary of EMC Part 15.249 Compliance Testing

II. Equipment Configuration

A. Overview

MET Laboratories, Inc. was contracted by Exalt Wireless – San Jose to perform testing on the ExtendAir G2 24GHz (rc24020), under Exalt Wireless – San Jose’ purchase order number 109107.

This document describes the test setups, test methods, required test equipment, and the test limit criteria used to perform compliance testing of the Exalt Wireless – San Jose, ExtendAir G2 24GHz (rc24020).

The results obtained relate only to the item(s) tested.

Model(s) Tested:	ExtendAir G2 24GHz (rc24020)	
EUT Specifications:	Primary Power to Module: 48 VDC	
	FCC ID: TTM-124P05P IC: 6254A-124P05P	
	Equipment Code:	DXX
	Highest Fundamental Field Strength:	128 dBuV/m
	EUT Frequency Ranges:	24,000 – 24,250 MHz
Analysis:	The results obtained relate only to the item(s) tested.	
Environmental Test Conditions:	Temperature (15-35° C)	
	Relative Humidity (30-60%)	
	Barometric Pressure (860-1060 mbar)	
Evaluated by:	Kaushani Dasgupta	
Report Date(s):	March 10, 2016	

Table 2. EUT Specifications

Note: Device only supports channels one at a time. Here we are using three channels for the testing .

C. Test Site

All testing was performed at MET Laboratories, Inc., 3162 Belick St., Santa Clara, CA 95054. All equipment used in making physical determinations is accurate and bears recent traceability to the National Institute of Standards and Technology.

Radiated Emissions measurements were performed in a semi-anechoic chamber (equivalent to an Open Area Test Site). In accordance with §2.948(a)(3), a complete site description is contained at MET Laboratories.

D. Description of Test Sample

The all-outdoor ExtendAir G2 24GHz system is a high performance, point-to-point Gigabit Ethernet radio built for use in 24GHz un-licensed bands. Designed to deliver guaranteed full-duplex Ethernet throughput of up to 370 Mbps for short-haul and medium-range applications, the ExtendAir G2 24GHz all-outdoor radio is rugged, zero footprint systems requiring no cabinet space. Exalt's ExtendAir G2 yields a cost-effective, yet feature-rich radio solution for service provider and enterprise applications where high reliability transmission is critical.

3	N.A.	CAT5 NOT PROVIDED	0	ANY	N	1000BaseT DATA

Table 6. Ports and Cabling Information

H. Mode of Operation

There are multiple bandwidths of operation. 3.5/5/7/10/14/20/25/28/30/40/50/56MHz wide and 6 modes of operation with modulations of QPSK, 16QAM, 32QAM, 64QAM, 128QAM AND 256QAM.

Both BW and Modulation can be configured using the user interface (GUI) for the allowed combination.

Note: Out of all the modes stated above, since the customer wanted us to use the highest and lowest data rate that's why we used QPSK and QAM data rate. And that's how high it went for the above given bandwidths.

I. Modifications

a) Modifications to EUT

No modifications were made to the EUT.

b) Modifications to Test Standard

No modifications were made to the test standard.

J. Disposition of EUT

The test sample including all support equipment submitted to the Electro-Magnetic Compatibility Lab for testing was returned to Exalt Wireless - San Jose upon completion of testing.

III. Electromagnetic Compatibility Criteria for Intentional Radiators

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.203 Antenna Requirement

Test Requirement: § 15.203: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

The structure and application of the EUT were analyzed to determine compliance with Section 15.203 of the Rules. Section 15.203 states that the subject device must meet at least one of the following criteria:

- a.) Antenna must be permanently attached to the unit.
- b.) Antenna must use a unique type of connector to attach to the EUT.
- c.) Unit must be professionally installed. Installer shall be responsible for verifying that the correct antenna is employed with the unit.

Test Results: The EUT as tested is compliant with the criteria of §15.203. In general requirements of the part 15 devices, by inspection of the device it can be declared that the unit is compatible with one of the requirement of Section 15.203. And the unit is professionally installed and the installer did verify that the correct antenna is employed with the unit.

Test Engineer(s): Kaushani Dasgupta

Test Date(s): 10/09/15

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.207(a) Conducted Emissions Limits

Test Requirement(s): § 15.207 (a): For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 Σ line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Frequency range (MHz)	§ 15.207(a), Conducted Limit (dB μ V)	
	Quasi-Peak	Average
* 0.15- 0.45	66 - 56	56 - 46
0.45 - 0.5	56	46
0.5 - 30	60	50

Table 7. Conducted Limits for Intentional Radiators from FCC Part 15 § 15.207(a)

Test Procedure: The EUT was placed on a 0.8 m-high wooden table inside a screen room. The EUT was situated such that the back of the EUT was 0.4 m from one wall of the vertical ground plane, and the remaining sides of the EUT were no closer than 0.8 m from any other conductive surface. The EUT was powered from a 50 Ω /50 μ H Line Impedance Stabilization Network (LISN). The EMC receiver scanned the frequency range from 150 kHz to 30 MHz. Conducted Emissions measurements were made in accordance with *ANSI C63.4-2014 "Methods and Measurements of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40 GHz"*. The measurements were performed over the frequency range of 0.15 MHz to 30 MHz using a 50 Ω /50 μ H LISN as the input transducer to an EMC/field intensity meter. For the purpose of this testing, the transmitter was turned on. Scans were performed with the transmitter on.

Test Results: The EUT was compliant with this requirement.

Test Engineer(s): Kaushani Dasgupta

Electromagnetic Compatibility Criteria for Intentional Radiators

§15.249(b)(1) Radiated Field Strength of Fundamental

Test Requirements: § 15.249(b)(1): Fixed, point-to-point operation as referred to in this paragraph shall be limited to systems employing a fixed transmitter transmitting to a fixed remote location. Point-to-multipoint systems, omnidirectional applications, and multiple co-located intentional radiators transmitting the same information are not allowed. Fixed, point-to-point operation is permitted in the 24.05–24.25 GHz band subject to the following conditions:

The field strength of emissions in this band shall not exceed 2500 millivolts/meter.

Test Procedure: Measurements were performed with the EUT rotated 360 degrees and varying the adjustable antenna mast with 1 m to 4 m height to determine worst case orientation for maximum emissions. The antenna was placed 3m away from the EUT. The EUT was rotated about all three orthogonal axis. Therefore the field strength limit is based on a 3m distance.

Test Results: The EUT is compliant with the requirements of § 15.249(b)(1).

Table 16. Field Strength of Fundamental, 50MHz

Note: Field Strength of Fundamental Limit = 2500 mV/m = 2,500,000 uV/m
 $= 20 \log (2,500,000)$
 Field Strength of Fundamental Limit = 128 dBuV/m

Note: Due to the higher field strength limit for this device, a MPE section with an RF Exposure Evaluation is also calculated to make sure the public is not exposed to radio frequency energy levels.

Maximum Permissible Exposure

RF Exposure Requirements: §1.1307(b)(1) and §1.1307(b)(2): Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the Commission's guidelines.

RF Radiation Exposure Limit: §1.1310: As specified in this section, the Maximum Permissible Exposure (MPE) Limit shall be used to evaluate the environmental impact of human exposure to radiofrequency (RF) radiation as specified in Sec. 1.1307(b), except in the case of portable devices which shall be evaluated according to the provisions of Sec. 2.1093 of this chapter.

MPE Limit: **Limit for Uncontrolled exposure: 1 mW/cm² or 10 W/m²**

$$S = PG / 4\pi R^2 \quad \text{or} \quad R = \sqrt{PG / 4\pi S}$$

where, S = Power Density (mW/cm²)
P = Power Input to antenna (mW)
G = Antenna Gain (numeric value)
R = Distance (cm)

Test Results:

The highest field strength calculated in the above section is : 127.94 dBuV/m
Therefore,

$$\begin{aligned} \text{EIRP} &= \text{Field strength} + 20 \log(d/1) - 104.77 \\ &= 127.94 + 20 \log(3/1) - 104.77 \\ &= 32.712 \text{ dBm} \\ &= 1.8672 \text{ watt or } 1867.2 \text{ mW} \end{aligned}$$

Since EIRP = Conducted power (P) * Antenna Gain (G)
PG = 1867.2 mW

Now according to the formula given above to calculate the MPE,

$$S = PG / 4\pi R^2,$$

Where,

$$PG = 1867.2 \text{ mW}, R = 20 \text{ cm}$$

$$\begin{aligned} &= 1867.2 / 4 * 3.14 * 20^2 \\ &= \mathbf{0.371 \text{ mW/cm}^2} \end{aligned}$$

Therefore , the MPE is less than the exposure limit (1mW/cm²) .

The safe distance where Power Density is less than the MPE Limit listed above was found to be 20 cm.

Electromagnetic Compatibility Criteria for Intentional Radiators

§15.249(b)(2) Frequency Tolerance

Test Requirements: § 15.249(b)(2): The frequency tolerance of the carrier signal shall be maintained within
 • $\pm 0.001\%$ of the operating frequency over a temperature variation of -20 degrees to +50 degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment, the equipment tests shall be performed using a new battery.

Test Procedure: The EUT was placed in the Environmental Chamber and support equipment are outside the chamber on a table. A CW signal was injected into the EUT at the appropriate RF level. The frequency counter option on the Spectrum Analyzer was used to measure frequency deviations. The frequency drift was investigated for every 10° C increment until the unit is stabilized then recorded the reading in tabular format with the temperature range of -20° to +50° C.

Voltage supplied to EUT is 120 VAC reference temperature was done at 20° C. The voltage was varied by $\pm 15\%$ of nominal.

Test Results: The EUT is compliant with the requirements of § 15.249(b)(2).

Test Engineer(s): Kaushani Dasgupta

Test Date(s): 09/30/15

Note: As per the Standard: Frequency tolerance of the carrier signal shall be maintained and should lie within $\pm 0.001\%$ of the operating frequency.

Therefore limit for maximum allowable drift would be $= 0.001 * 24075 / 100 = 0.24075$ MHz

Operating Low Frequency Channel = 24075.000 MHz

Electromagnetic Compatibility Criteria for Intentional Radiators

§15.249(b)(3) Antenna Performance

Antenna used for testing: 0.6 mm(2ft dish) Ultra high performance low profile antenna with antenna gain 41dBi .

Test Requirements: § 15.249(b)(3): Antenna gain must be at least 33 dBi. Alternatively, the main lobe beamwidth must not exceed 3.5 degrees. The beamwidth limit shall apply to both the azimuth and elevation planes. At antenna gains over 33 dBi or beamwidths narrower than 3.5 degrees, power must be reduced to ensure that the field strength does not exceed 2500 millivolts/meter.

Test Results: The EUT is compliant with the requirements of § 15.249(b)(3). Since the gain of the antenna is way higher than 33dBi. The Antenna gains (dBi) of this device are: 36/41. Therefore it does comply with the requirement of the gain being at least 33dBi.

Test Engineer(s): Kaushani Dasgupta

Test Date(s): 10/19/15

Wind Forces

The axial, side and twisting moment forces stated are maximum loads applied to the tower by the antenna at a survival wind speed of 250 km/h (70m/s). They are, in every case, the result of wind from the most critical direction for each parameter. The individual maximums may not occur simultaneously. All forces are referenced to the antenna mounting pipe.

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.249(a)(d) Spurious Emissions

Test Requirements:	Harmonics originating from devices that operate in the 24.0-24.25 GHz band shall meet the 2500 microvolts/meter limit (i.e. 68 dBμV/m) with an average detector. In addition, emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209, whichever is the lesser attenuation.
Test Procedure:	Measurements were performed with the EUT rotated 360 degrees and varying the adjustable antenna mast with 1 m to 4 m height to determine worst case orientation for maximum emissions. Emissions below 1 GHz were performed with the antenna placed 3m away from EUT. For above 1 GHz, the measuring antenna was placed 1m away. Measurements were performed from 30MHz to 100GHz.
Note:	For spurious emission measurements between 18GHz and 40GHz- two plots were demonstrated- one with added measurement correction factor and other without adding correction to final measurement. Since over all emission profile from both of these plots look identical, the only difference is the noise floor. In order to show that the reason for the emission plot to be above the limit is because of the noise floor and not coming from the unit. Hence, we recorded the plots twice. Plot 1 with the correction factors ON and the Plot 2 with the factors OFF. This shows that the difference in the plots is due to the noise floor and not the noise from the unit. Above 40 GHz, only peak measurements under average limit is being taken, since the worst case scenario is considered above 40 GHz.
Test Results:	The EUT is compliant with the harmonics and Spurious Emissions Requirements of §15.249(a)(d).

Electromagnetic Compatibility Criteria for Intentional Radiators

§2.1049 & RSS-GEN (6.6) 99% Occupied Bandwidth

Test Requirements: **§2.1049:** The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured

RSS-GEN (6.6): The emission bandwidth ($\times$ dB) is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated $\times$ dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth in the range of 1% to 5% of the anticipated emission bandwidth, and a video bandwidth at least $3\times$ the resolution bandwidth.

When the occupied bandwidth limit is not stated in the applicable RSS or reference measurement method, the transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured.

- The transmitter shall be operated at its maximum carrier power measured under normal test conditions.
- The span of the analyzer shall be set to capture all products of the modulation process, including the emission skirts.
- The resolution bandwidth (RBW) shall be in the range of 1% to 5% of the occupied bandwidth (OBW) and video bandwidth (VBW) shall be approximately $3\times$ RBW.

Note: Video averaging is not permitted.

A peak, or peak hold, may be used in place of the sampling detector as this may produce a wider bandwidth than the actual bandwidth (worst-case measurement). Use of a peak hold may be necessary to determine the occupied bandwidth if the device is not transmitting continuously.

The trace data points are recovered and are directly summed in linear power level terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5% of the total is reached and that frequency recorded. The process is repeated for the highest frequency data points (starting at the highest frequency, at the right side of the span, and going down in frequency). This frequency is then recorded.

The difference between the two recorded frequencies is the 99% occupied bandwidth.

Test Procedure: The transmitter was on and transmitting at the highest output power. The bandwidth of the fundamental frequency was measured with the spectrum analyzer using a RBW approximately 1% of the total emission bandwidth, $VBW > RBW$. The 99% Bandwidth was measured and recorded. The measurements were performed on the low, mid and high channels.

Test Results The EUT was compliant with RSS-GEN (6.6).

The 99% Bandwidth was determined from the plots on the following pages.

Electromagnetic Compatibility Criteria for Intentional Radiators

§RSS-210 A12 Power to Antenna

Test Requirements: Fixed, point-to-point operation is permitted in the band 24.05–24.25 GHz under the following condition:

The power delivered to the antenna shall not exceed 1 mW.

Test Procedure: The transmitter was connected to a calibrated spectrum analyzer. The EUT was measured at the low, mid and high channels at the maximum power level for all the given bandwidths.

Test Results The EUT was compliant with this section.

Test Engineer(s): Kaushani Dasgupta

Test Date(s): 02/22/16

V. Certification & User's Manual Information

Certification & User's Manual Information

A. Certification Information

The following is extracted from Title 47 of the Code of Federal Regulations, Part 2, Subpart I — Marketing of Radio frequency devices:

§ 2.801 Radio-frequency device defined.

As used in this part, a radio-frequency device is any device which in its operation is capable of Emitting radio-frequency energy by radiation, conduction, or other means. Radio- frequency devices include, but are not limited to:

- (a) The various types of radio communication transmitting devices described throughout this chapter.
- (b) *The incidental, unintentional and intentional radiators defined in Part 15 of this chapter.*
- (c) The industrial, scientific, and medical equipment described in Part 18 of this chapter.
- (d) Any part or component thereof which in use emits radio-frequency energy by radiation, conduction, or other means.

§ 2.803 Marketing of radio frequency devices prior to equipment authorization.

- (a) Except as provided elsewhere in this chapter, no person shall sell or lease, or offer for sale or lease (including advertising for sale or lease), or import, ship or distribute for the purpose of selling or leasing or offering for sale or lease, any radio frequency device unless:
 - (1) In the case of a device subject to certification, such device has been authorized by the Commission in accordance with the rules in this chapter and is properly identified and labeled as required by §2.925 and other relevant sections in this chapter; or
 - (2) In the case of a device that is not required to have a grant of equipment authorization issued by the Commission, but which must comply with the specified technical standards prior to use, such device also complies with all applicable administrative (including verification of the equipment or authorization under a Declaration of Conformity, where required), technical, labeling and identification requirements specified in this chapter.
- (d) Notwithstanding the provisions of paragraph (a) of this section, the offer for sale solely to business, commercial, industrial, scientific or medical users (but not an offer for sale to other parties or to end users located in a residential environment) of a radio frequency device that is in the conceptual, developmental, design or pre-production stage is permitted prior to equipment authorization or, for devices not subject to the equipment authorization requirements, prior to a determination of compliance with the applicable technical requirements *provided* that the prospective buyer is advised in writing at the time of the offer for sale that the equipment is subject to the FCC rules and that the equipment will comply with the appropriate rules before delivery to the buyer or to centers of distribution.

- (e)(1) Notwithstanding the provisions of paragraph (a) of this section, prior to equipment authorization or determination of compliance with the applicable technical requirements any radio frequency device may be operated, but not marketed, for the following purposes and under the following conditions:
- (i) *Compliance testing;*
 - (ii) Demonstrations at a trade show provided the notice contained in paragraph (c) of this section is displayed in a conspicuous location on, or immediately adjacent to, the device;
 - (iii) Demonstrations at an exhibition conducted at a business, commercial, industrial, scientific or medical location, but excluding locations in a residential environment, provided the notice contained in paragraphs (c) or (d) of this section, as appropriate, is displayed in a conspicuous location on, or immediately adjacent to, the device;
 - (iv) Evaluation of product performance and determination of customer acceptability, provided such operation takes place at the manufacturer's facilities during developmental, design or pre-production states; or
 - (v) Evaluation of product performance and determination of customer acceptability where customer acceptability of a radio frequency device cannot be determined at the manufacturer's facilities because of size or unique capability of the device, provided the device is operated at a business, commercial, industrial, scientific or medical user's site, but not at a residential site, during the development, design or pre-production stages.
- (e)(2) For the purpose of paragraphs (e)(1)(iv) and (e)(1)(v) of this section, the term *manufacturer's facilities* includes the facilities of the party responsible for compliance with the regulations and the manufacturer's premises, as well as the facilities of other entities working under the authorization of the responsible party in connection with the development and manufacture, but not the marketing, of the equipment.
- (f) For radio frequency devices subject to verification and sold solely to business, commercial, industrial, scientific and medical users (excluding products sold to other parties or for operation in a residential environment), parties responsible for verification of the devices shall have the option of ensuring compliance with the applicable technical specifications of this chapter at each end user's location after installation, provided that the purchase or lease agreement includes a proviso that such a determination of compliance be made and is the responsibility of the party responsible for verification of the equipment.

Certification & User's Manual Information

The following is extracted from Title 47 of the Code of Federal Regulations, Part 2, Subpart J — Equipment Authorization Procedures:

§ 2.901 Basis and Purpose

- (a) In order to carry out its responsibilities under the Communications Act and the various treaties and international regulations, and in order to promote efficient use of the radio spectrum, the Commission has developed technical standards for radio frequency equipment and parts or components thereof. The technical standards applicable to individual types of equipment are found in that part of the rules governing the service wherein the equipment is to be operated.¹ *In addition to the technical standards provided, the rules governing the service may require that such equipment be verified by the manufacturer or importer, be authorized under a Declaration of Conformity, or receive an equipment authorization from the Commission by one of the following procedures: certification or registration.*
- (b) The following sections describe the verification procedure, the procedure for a Declaration of Conformity, and the procedures to be followed in obtaining certification from the Commission and the conditions attendant to such a grant.

§ 2.907 Certification.

- (a) Certification is an equipment authorization issued by the Commission, based on representation and test data submitted by the applicant.
- (b) Certification attaches to all units subsequently marketed by the grantee which are identical (see Section 2.908) to the sample tested except for permissive changes or other variations authorized by the Commission pursuant to Section 2.1043.

¹ In this case, the equipment is subject to the rules of Part 15. More specifically, the equipment falls under Subpart B (of Part 15), which deals with unintentional radiators.

Certification & User's Manual Information

§ 2.948 Description of measurement facilities.

- (a) Each party making measurements of equipment that is subject to an equipment authorization under Part 15 or Part 18 of this chapter, regardless of whether the measurements are filed with the Commission or kept on file by the party responsible for compliance of equipment marketed within the U.S. or its possessions, shall compile a description of the measurement facilities employed.
 - (1) If the measured equipment is subject to the verification procedure, the description of the measurement facilities shall be retained by the party responsible for verification of the equipment.
 - (i) *If the equipment is verified through measurements performed by an independent laboratory, it is acceptable for the party responsible for verification of the equipment to rely upon the description of the measurement facilities retained by or placed on file with the Commission by that laboratory. In this situation, the party responsible for the verification of the equipment is not required to retain a duplicate copy of the description of the measurement facilities.*
 - (ii) If the equipment is verified based on measurements performed at the installation site of the equipment, no specific site calibration data is required. It is acceptable to retain the description of the measurement facilities at the site at which the measurements were performed.
 - (2) If the equipment is to be authorized by the Commission under the certification procedure, the description of the measurement facilities shall be filed with the Commission's Laboratory in Columbia, Maryland. The data describing the measurement facilities need only be filed once but must be updated as changes are made to the measurement facilities or as otherwise described in this section. At least every three years, the organization responsible for filing the data with the Commission shall certify that the data on file is current.

Certification & User's Manual Information

Label and User's Manual Information

The following is extracted from Title 47 of the Code of Federal Regulations, Part 15, Subpart A — General:

§ 15.19 Labeling requirements.

(a) *In addition to the requirements in Part 2 of this chapter, a device subject to certification or verification shall be labeled as follows:*

- (1) Receivers associated with the operation of a licensed radio service, e.g., FM broadcast under Part 73 of this chapter, land mobile operation under Part 90, etc., shall bear the following statement in a conspicuous location on the device:

This device complies with Part 15 of the FCC Rules. Operation is subject to the condition that this device does not cause harmful interference.

- (2) A stand-alone cable input selector switch, shall bear the following statement in a conspicuous location on the device:

This device is verified to comply with Part 15 of the FCC Rules for use with cable television service.

- (3) All other devices shall bear the following statement in a conspicuous location on the device:

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

- (4) Where a device is constructed in two or more sections connected by wires and marketed together, the statement specified under paragraph (a) of this section is required to be affixed only to the main control unit.
- (5) When the device is so small or for such use that it is not practicable to place the statement specified under paragraph (a) of this section on it, the information required by this paragraph shall be placed in a prominent location in the instruction manual or pamphlet supplied to the user or, alternatively, shall be placed on the container in which the device is marketed. However, the FCC identifier or the unique identifier, as appropriate, must be displayed on the device.

§ 15.21 Information to user.

The users manual or instruction manual for an intentional or unintentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Verification & User's Manual Information

The following is extracted from Title 47 of the Code of Federal Regulations, Part 15, Subpart B — Unintentional Radiators:

§ 15.105 Information to the user.

- (a) For a Class A digital device or peripheral, the instructions furnished the user shall include the following or similar statement, placed in a prominent location in the text of the manual:

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at own expense.

- (b) For a Class B digital device or peripheral, the instructions furnished the user shall include the following or similar statement, placed in a prominent location in the text of the manual:

Note: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a residential environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

ICES-003 Procedural & Labeling Requirements

From the Industry Canada Electromagnetic Compatibility Advisory Bulletin entitled, "Implementation and Interpretation of the Interference-Causing Equipment Standard for Digital Apparatus, ICES-003" (EMCAB-3, Issue 2, July 1995):

"At present, CISPR 22: 2002 and ICES technical requirements are essentially equivalent. Therefore, if you have CISPR 22: 2002 approval by meeting CISPR Publication 22, the only additional requirements are: to attach a note to the report of the test results for compliance, indicating that these results are deemed satisfactory evidence of compliance with ICES-003 of the Canadian Interference-Causing Equipment Regulations; to maintain these records on file for the requisite five year period; and to provide the device with a notice of compliance in accordance with ICES-003."

Procedural Requirements:

According to Industry Canada's Interference Causing Equipment Standard for Digital Apparatus ICES-003 Issue 4, February 2004:

- Section 6.1: A record of the measurements and results, showing the date that the measurements were completed, shall be retained by the manufacturer or importer for a period of at least five years from the date shown in the record and made available for examination on the request of the Minister.
- Section 6.2: A written notice indicating compliance must accompany each unit of digital apparatus to the end user. The notice shall be in the form of a label that is affixed to the apparatus. Where because of insufficient space or other constraints it is not feasible to affix a label to the apparatus, the notice may be in the form of a statement in the user's manual.

Labeling Requirements:

The suggested text for the notice, in English and in French, is provided below, from the Annex of ICES-003:

This Class [²] digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe [¹] est conforme à la norme NMB-003 du Canada.

² Insert either A or B but not both as appropriate for the equipment requirements.

End of Report
