Note(s):

1. The stated antenna gains are the maximum gains for the frequency range 2400 MHz to 2483.5 MHz.
2. Transmitter radiated spurious emissions and band edge emissions were tested on both antennas.

4. Operation and Monitoring of the EUT during Testing

4.1. Operating Modes

The EUT was tested in the following operating mode(s):

- Continuously transmitting with a modulated carrier at maximum power on the bottom, middle and top channels as required using the supported data rates/modulation types.

4.2. Configuration and Peripherals

The EUT was tested in the following configuration(s):

- The EUT was inserted into the supplied test jig. The test jig was powered via a 120 VAC 60 Hz to 5 VDC power supply using the Goobay AC to DC adaptor. The test jig then supplied the EUT with the required 3.3 VDC.
- The Lenovo ThinkPad X61 laptop PC was connected to the EUT via a USB cable. The EUT was initialised using a software application supplied by the manufacturer. Once initialised, the EUT was controlled by the Dell D610 laptop PC, which was connected to the ThinkPad X61 via a Linksys access point using a software application supplied by the manufacturer. The application was used to enable continuous transmission and to select the test channels as required.
- The EUT has two RF ports, both are transmit/receive RF ports (labelled as Port 0 and Port 1) and for 802.11n the EUT supports MIMO. Conducted measurements were performed on Port 0 and Port 1. For 802.11n, power related measurements have been summed.
- 802.11n MCS 0 to 7 is correlated and CCD. Antennas are not cross polarised.
- RF cables and attenuators connecting the test equipment to the EUT ports were calibrated before use and the calibration data incorporated into the conducted measurement results.
- All supported modes and channel widths were initially investigated on one channel, on both ports. The modes that produced the highest output power, highest power spectral density, narrowest and widest bandwidths were:
 - o Highest output power
 - o 802.11b – DQPSK / 11 Mbit/s
 - o 802.11g – QPSK / 12 Mbit/s
 - o 802.11n HT20 – QPSK / 39 Mbit/s / MCS10
 - o 802.11n HT40 – QPSK / 81 Mbit/s / MCS10
 - o Highest power spectral density
 - o 802.11b – DQPSK / 2 Mbit/s
 - o 802.11g – QPSK / 12 Mbit/s
 - o 802.11n HT20 – QPSK / 39 Mbit/s / MCS10
 - o 802.11n HT40 – QPSK / 81 Mbit/s / MCS10
 - o Narrowest bandwidth (DTS bandwidth / 6 dB)
 - o 802.11b – DQPSK / 11 Mbit/s
 - o 802.11g – BPSK / 9 Mbit/s
 - o 802.11n HT20 – QPSK / 39 Mbit/s / MCS10
 - o 802.11n HT40 – QPSK / 40.5 Mbit/s / MCS2

Configuration and Peripherals (continued)

- Transmitter spurious emissions were performed with the EUT transmitting 802.11g 20 MHz channel bandwidth with one spatial stream and a data rate of 12 Mbit/s. This was found to have the highest power level and therefore deemed to be worst case.
- Radiated emissions tests were performed with all unused ports terminated.

5. Measurements, Examinations and Derived Results

5.1. General Comments

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to *Section 6. Measurement Uncertainty* for details.

In accordance with UKAS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

5.2.4. Transmitter Radiated Emissions – UAM Antenna**Test Summary:**

Test Engineer:	Sandeep Bharat	Test Date:	03 January 2014
Test Sample MAC Address:	240A546D213		

FCC Reference:	Parts 15.247(d) & 15.209(a)
Test Method Used:	As detailed in ANSI C63.10 Sections 6.3 and 6.5 referencing ANSI C63.4
Frequency Range	30 MHz to 1000 MHz

Environmental Conditions:

Temperature (°C):	23
Relative Humidity (%):	40

Note(s):

1. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
2. The preliminary scans showed similar emission levels below 1 GHz, for each channel of operation. Therefore final radiated emissions measurements were performed with the EUT set to the top channel only.
3. All emissions shown on the pre-scan plot were investigated and found to be ambient, or >20 dB below the applicable limit or below the measurement system noise floor. Therefore the highest measured level of the noise floor is recorded in the table below.
4. Measurements below 1 GHz were performed in a semi-anechoic chamber (Asset Number K0001) at a distance of 3 metres. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 metre to 4 metres.

Frequency Range	1 GHz to 25 GHz

Environmental Conditions:

Temperature (°C):	22

Note(s):

1. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
2. All other emissions shown on the pre-scan plots were investigated and found to be ambient or >20 dB below the applicable limit or below the measurement system noise floor.
3. The emission shown approximately at 2462 MHz on the 1 GHz to 4 GHz plot is the EUT fundamental.
4. Pre-scans above 1 GHz were performed in a fully anechoic chamber (Asset Number K0002) at a distance of 3 metres. The EUT was placed at a height of 1.5 metres above the test chamber floor in the centre of the chamber turntable. All measurement antennas were placed at a fixed height of 1.5 metres above the test chamber floor, in line with the EUT. Final measurements above 1 GHz were performed in a semi-anechoic chamber (Asset Number K0001) at a distance of 3 metres. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 metre to 4 metres.
5. *Emissions in restricted bands: In accordance with C63.10 section 6.6.4.2, Note 1, where the peak-detected amplitude was shown to comply with the average limit, an average measurement was not performed.
6. ** -20 dBc limit.

5.2.6. Transmitter Band Edge Radiated Emissions – UAM Antenna**Test Summary:**

Test Engineers:	David Doyle & Sandeep Bharat	Test Date:	20 December 2013
Test Sample MAC Address:	240A546D213		

FCC Reference:	Parts 15.247(d) & 15.209(a)
Test Method Used:	As detailed in ANSI C63.10 Section 6.9.2

Environmental Conditions:

Temperature (°C):	23
Relative Humidity (%):	35

Note(s):

1. All configurations supported by the EUT were investigated on one channel. The data rates that produced the highest power and widest bandwidth were therefore deemed worst case:
 - o 802.11b – DQPSK / 11 Mbit/s & DBPSK / 2 Mbit/s
 - o 802.11g – QPSK / 12 Mbit/s
 - o 802.11n HT20 – QPSK / 39 Mbit/s / MCS10 & 16QAM / 52 Mbit/s / MCS11
 - o 802.11n HT40 – QPSK / 81 Mbit/s / MCS10 & 16QAM / 108 Mbit/s / MCS11
2. Final measurements were performed with the above configurations.
3. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
4. In accordance with FCC KDB 558074 Section 11.1(a), the lower band edge measurement was performed with a peak detector and the -20 dBc limit applied.
5. * -20 dBc limit.
6. For 802.11g and 802.11n, the lower band edge plots show an incorrect display line at -30 dBc. The limit in the results tables has been corrected to -20 dBc.
7. Some upper band edge peak measurements were performed with a reference level of 120 dBμV (ANSI C63.10 Section 6.9.2 procedure requirement is 110 dBμV) as the peak of the carrier exceeded 110 dBμV. This has no effect on the test result and the measured band edge levels for these configurations were compliant.

Test Engineers:	David Doyle & Sandeep Bharat	Test Date:	07 January 2014
Test Sample MAC Address:	240A546D213		

FCC Reference:	Parts 15.247(d) & 15.209(a)
Test Method Used:	As detailed in ANSI C63.10 Section 6.9.2

Environmental Conditions:

Temperature (°C):	22
Relative Humidity (%):	41

Note(s):

1. All configurations supported by the EUT were investigated on one channel. The data rates that produced the highest power and widest bandwidth were therefore deemed worst case :
 - o 802.11b – DQPSK / 11 Mbit/s & DBPSK / 2 Mbit/s
 - o 802.11g – QPSK / 12 Mbit/s
 - o 802.11n HT20 – QPSK / 39 Mbit/s / MCS10 & 16QAM / 52 Mbit/s / MCS11
 - o 802.11n HT40 – QPSK / 81 Mbit/s / MCS10 & 16QAM / 108 Mbit/s / MCS11
2. Final measurements were performed with the above configurations.
3. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
4. In accordance with FCC KDB 558074 Section 11.1(a), the lower band edge measurement was performed with a peak detector and the -20 dBc limit applied.
5. * -20 dBc limit.

6. Measurement Uncertainty

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

Measurement Type	Range	Confidence Level (%)	Calculated Uncertainty
AC Conducted Spurious Emissions	0.15 MHz to 30 MHz	95%	±4.69 dB
Spectral Power Density	2.4 GHz to 2.4835 GHz	95%	±1.13 dB
Occupied Bandwidth	2.4 GHz to 2.4835 GHz	95%	±3.92 %
Radiated Spurious Emissions	30 MHz to 1 GHz	95%	±5.65 dB
Radiated Spurious Emissions	1 GHz to 25 GHz	95%	±2.94 dB

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.
