Gregory Fisher, Jimmy Li
c/o Hitron Technologies Inc.
304 Inverness Way South, Suite 480
Englewood CO 80113 USA

Gentlemen:

Thank you for allowing Professional Testing (EMI), Inc. an opportunity to perform testing for Hitron Technologies. Enclosed is the Wireless Certification Report for the HT-DW1. This report can be used to demonstrate compliance with requirements for wireless devices in the United States and Canada.

If you have any questions, please contact me.

Sincerely,

Jeffrey A. Lenk
President

*MPE is reported separately from this document.

I, Jeffrey A. Lenk, for Professional Testing (EMI), Inc., being familiar with the FCC rules and test procedures, have reviewed the test setup, measured data, and this report. I believe them to be true and accurate.

Jeffrey A. Lenk
 President

This report has been reviewed and accepted by Hitron Technologies Inc. The undersigned is responsible for ensuring that the HT-DW1 by Hitron Technologies Inc. will continue to comply with the applicable rules.

 Representative of Hitron Technologies Inc.

1.0 Introduction

1.1 Scope

This report describes the extent to which the equipment under test (EUT) conformed to the intentional radiator requirements of the United States.

Professional Testing (EMI), Inc., (PTI) follows the guidelines of National Institute of Standards and Technology (NIST) for all uncertainty calculations, estimates, and expressions thereof for electromagnetic compatibility testing. The procedures of ANSI C63.4: 2009 were used for making all radiated enclosure and mains emission measurements.

1.2 EUT Description

The EUT is the **HT-DW1** by **Hitron**. This device is a wireless transmitter that beacons data to a central receiver. The EUT as tested consisted of the following:

Table 1.2.1: Equipment Under Test

Manufacturer	Model	Serial #	Description
Hitron Technologies Inc.	HT-DW1	None	Wireless door/window security sensor.

This device is used to detect intrusions for doors and windows of a structure.

The antenna is internal to a chip on the circuit board. There is no antenna connector. The EUT is powered by a 3 V coin type cell.

The EUT measures approximately 31 x 31 x 11 mm. A photograph of the EUT is provided below.

Photograph 1.2.1: EUT

1.3 EUT Operation

The EUT was exercised in a manner consistent with normal operations. This is not a hand held device.

The EUT internal software operated the transmitter in a continuous modulated mode. It was programmed to change channels when the sensor first detected a magnet nearby. On each re-approach of the magnet the EUT would advance to the next channel and return to the low channel after the high channel. The channelization is by the commonly known Zigbee scheme.

1.4 Modifications to Equipment

No modifications were made to the EUT during the performance of the test program.

1.5 Test Site

Measurements were made at the PTI semi-anechoic facility designated Site 45 (FCC 459644, IC 3036B-1) in Austin, Texas. The site is registered with the FCC under Section 2.948 and Industry Canada per RSS-GEN, and is subsequently confirmed by laboratory accreditation (NVLAP). The test site is located at 11400 Burnet Road, Austin, Texas 78758, while the main office is located at 1601 North A.W. Grimes Boulevard, Suite B, Round Rock, Texas, 78665.

2.0 Fundamental Power

2.1 Test Procedure

EUT is placed on a non-conducting table and rotated to record the maximum emission. Bandwidth is first determined to select correct entire bandwidth for power measurement and the fundamental power is measured.

2.2 Test Criteria

47 CFR (USA) // IC (Canada)		
Section Reference	Parameter	Date
15.247(a)(3) // RSS-210 Issue 8, A2.9	Fundamental Power Conducted Limit: 1 Watt Restated as Field Strength 125.2 dBμV/m @ 3 m	2014-02-23

2.3 Test Results

The EUT bandwidth was found to be between 1 MHz and 3 MHz, the measurement resolution bandwidth was set to 3 MHz; video bandwidth was set to 3 MHz. Results are presented below:

Fundamental Power Measured as Field Strength Conducted Limit 1 Watt (30 dBm) Limit Restated as Field Strength 125.2 dBμV/m @ 3 m
--

Vertical Polarity	
Frequency GHz	Corrected Measured Peak Power at 3 m dBμV/m
2.405	76.8
2.440	87.2
2.480	76.8

Measured in 3 MHz RBW, 3 MHz VBW.

Horizontal Polarity	
Frequency GHz	Corrected Measured Peak Power at 3 m dBμV/m
2.405	82.8
2.440	91.6
2.480	83.2

Measured in 3 MHz RBW, 3 MHz VBW.

Note that power on the lowest and highest channels is reduced in the design to insure band edge compliance. The EUT was found to be in compliance with the applicable criteria. Plotted measurement appears below.

2.3.1 Vertical Polarity

2.3.2 Horizontal Polarity

3.0 Power Spectral Density

3.1 Test Procedure

The EUT is placed on a non-conductive table and oriented for maximum signal. A spectrum analyzer is then adjusted to encompass the highest signals and allowed to record in max-hold mode for a time sufficient to capture all transmit products.

3.2 Test Criteria

47 CFR (USA) // IC (Canada)		
Section Reference	Parameter	Date
15.247e // RSS-210 Issue 8, A2.9	Power Spectral Density Conducted Limit: 8 dBm / 3 kHz Restated as Field Strength 103.2 dBμV/m @ 3 m Restated as Field Strength 112.7 dBμV/m @ 1 m	2014-02-20

3.3 Test Results

Power Spectral Density Conducted Limit 8 dBm, Measured Radiated Polarity Per Highest Measured for Peak Power

Frequency GHz	Polarity	Antenna Factor dB	Cable Loss dB	Corrected* Measured Peak PSD at 1 m dBμV/m
2.405	H	28.2	1.6	82.10
2.440	H	28.2	1.6	91.51
2.480	H	28.2	1.6	81.29

*Factors were added to spectrum analyzer amplitude offset to obtain a direct corrected measurement.

Sweep time 500 seconds.

Note that power on the lowest and highest channels is reduced in the design to insure band edge compliance.

The EUT was found to be in compliance with the applicable criteria.

Plotted measurements appear below.

3.3.1 Low Channel PSD

3.3.2 Middle Channel PSD

3.3.3 High Channel PSD

4.0 Transmitter Duty Cycle

Measurements of transmitter on time and intervals between transmissions were made to determine the duty cycle factor.

4.1 Test Procedure

EUT is placed into normal transmit operation to observe and record transmitter time domain performance.

4.2 Test Criteria

Measurement is based on intervals not to exceed 100 msec. Maximum transmitter on time is divided by the lesser of 100 msec or the actual measured minimum transmitter interval time. The result is converted to dB and applied as needed to peak measurements of transmitter artifacts to determine average power. This is not a pass/fail measurement.

4.3 Test Results

Due to the low peak power of the fundamental and spurious emissions, the duty cycle was not measured.

5.0 Occupied Bandwidth

5.1 Test Procedure

The EUT is configured for best signal/power and the bandwidth then is measured. A recording of the results is included.

5.2 Test Criteria

47 CFR (USA) // IC (Canada)		
Section Reference	Parameter	Date(s)
14.247(a)(2), 2.1049 // RSS-Gen Issue 3, 4.6	Bandwidth, 6 dB, 20 dB	2014-02-20

5.3 Test Results

EUT was found to be in compliance with applicable requirements.

Bandwidth 6 dB Minimum 500 kHz

Low Channel Measured BW (kHz)	Mid Channel Measured BW (kHz)	High Channel Measured BW (kHz)	Minimum BW (kHz)
1825.0	1510.0	1817.5	1510.0

Bandwidth 20 dB Measure and Report

Low Channel Measured BW (kHz)	Mid Channel Measured BW (kHz)	High Channel Measured BW (kHz)	Reported Maximum BW (kHz)
2595.0	2580.0	2617.5	2617.5

Plotted measurements appear on the following pages.

5.3.1 Bandwidth Plots, 6 dB

6 dB, Low Channel

6 dB, Middle Channel

Wireless Certification Report for the Hitron Technologies Inc. HT-DW1
6 dB, High Channel

5.3.2 Bandwidth Plots, 20 dB

20 dB, Low Channel

20 dB, Middle Channel

20 dB, High Channel

6.0 Band Edge

Measurements of transmitter emissions at the top and bottom band edge.

6.1 Test Procedure

The EUT was placed on a non-conductive table 0.8 meters above the ground plane. The table was centered on a rotating turntable at a distance of 3 meters from the measurement antenna.

EUT is placed into normal transmit operation on the nearest band edge channel. The spectrum analyzer is centered on the band edge frequency with span sufficient to include the peak of the adjacent fundamental signal. Measurement includes two standard bandwidths from the respective band edge. If required, the band-edge marker-delta method of C63.4 is utilized.

6.2 Test Criteria

47 CFR (USA) // IC (Canada)		
Section Reference	Parameter	Date(s)
15.205, 15.209 // RSS-Gen Issue 3, 4.9	Unwanted Emissions Adjacent to Authorized Band, Radiated	2014-02-23

6.3 Test Results

Peak detection emissions at band edges were below the general emission average limits. The EUT satisfied the criteria. Recorded data is presented below.

6.3.1 High Channel Band Edge

The curves are all under their respective limits with 1 MHz RBW. Consequently the delta procedure is not required.

6.3.2 Low Channel Band Edge

The curves are all under their respective limits with 1 MHz RBW. Consequently the delta procedure is not required.

7.0 Radiated Spurious Emissions Below 1 GHz

Out of band spurious/harmonic emissions measurements were performed on the EUT to determine compliance to 47 CFR, Part 15.

7.1 Test Procedure

The EUT was placed on a non-conductive table 0.8 meters above the ground plane. The table was centered on a rotating turntable at a distance of 10 meters from the measurement antenna.

Spurious emissions below 1 GHz were measured with quasi-peak detection with a resolution bandwidth of 120 kHz. A diagram showing the test setup is given in the figure below.

Figure 7.1.1: Field Strength of Spurious Emissions Test Setup

7.2 Test Criteria

47 CFR (USA) // IC (Canada)		
Section Reference	Parameter	Date(s)
15.247, 15.209 // RSS-Gen Issue 3, 4.9, 4.10	Field Strength of Radiated Spurious/Harmonic Emissions	2014-02-18

7.3 Test Results

The EUT satisfied the criteria. Recorded data is presented below.

Radiated Emissions, 10m Distance
30MHz - 1GHz Horizontal Polarity Measured Emissions

≤ 1GHz Horizontal Antenna Polarity Measured Emissions

8.0 Radiated Spurious Emissions Above 1 GHz

Out of band spurious/harmonic emissions measurements were performed on the EUT to determine compliance to 47 CFR, Part 15.

8.1 Test Procedure

The EUT was placed on a non-conductive table 0.8 meters above the ground plane. The table was centered on a rotating turntable at a distance of 1 meter from the measurement antenna.

Emissions from 1 GHz to 12 GHz are measured with peak detection, a resolution bandwidth of 1 MHz, and at a distance of 3 meters. If peak measurements exceeded average limits, the peak limit is applicable and duty cycle factor is then applied for average level calculation. For 12 GHz to 18 GHz, the measurement distance is 1 meter. Above 18 GHz, the measurement distance is 0.5 meters. Emissions are investigated up to 25 GHz to include the 10th harmonic of the transmitter fundamental.

Non-harmonic spurious emissions must satisfy the average limit and the peak limit (20 dB above average). A diagram showing the test setup is given in the figure below.

Figure 8.1.1: Field Strength of Spurious Emissions Test Setup

8.2 Test Criteria

47 CFR (USA) // IC (Canada)		
Section Reference	Parameter	Date(s)
15.247, 15.209 // RSS-Gen Issue 3, 4.9, 4.10	Field Strength of Radiated Spurious/Harmonic Emissions	2014-02-18

8.3 Test Results

In all cases detector mode is peak, RBW 1 MHz, VBW 3 MHz. The applicable duty cycle factor for averaging is 0 dB. The EUT was receiving on the center channel or transmitting on the indicated channel. All peak emissions can be seen as below the average limit, meaning the average level would also be under the average limit.

A pre-scan of emissions from 12 GHz to 25 GHz found no measurable signals.

Professional Testing, EMI, Inc Radiated Emissions, 3m Distance 1-18GHz Horizontal Polarity Measured Emissions The graph displays the radiated emissions of the EUT. The y-axis represents Field Strength in dBµV/m, ranging from 20 to 90. The x-axis represents Frequency in GHz, ranging from 1G to 12G. Two horizontal red lines indicate the Average Limit Level at approximately 75 dBµV/m and the Peak Limit Level at approximately 55 dBµV/m. The measured emissions, shown as a blue line, fluctuate between 30 and 45 dBµV/m, with several sharp peaks reaching up to 50 dBµV/m. A legend in the top right corner identifies the lines: Average Limit Level (red line), Corrected Average Reading (red triangle), Peak Limit Level (red line), and Corrected Peak Reading (blue line). The Professional Testing, EMI, Inc. logo is also present in the top right corner of the graph area. 9.0 Antenna Construction Requirements

The design was investigated for meeting the antenna construction requirements of the applicable rules.

9.1 Procedure

A direct examination of the antenna construction is performed and compared to rule criteria that prevent wireless device antennas from being modified by end users in ways that would void their authorization to use the device.

9.2 Criteria

47 CFR (USA) // IC (Canada)		
Section Reference	Parameter	Date(s)
15.203 // RSS-210 Issue 8, A2.9	Antenna Construction	2014-04-10

9.3 Results

Antenna Manufacturer and Model	Specifications	
ANT CER CHIP 2.4-2.5GHz 2dBi 5	Gain	2 dBi
Chip antenna on circuit board.		

- The antenna is internal only to the device.
- The antenna is a soldered-on component on the transmitter circuit board.
- There is no antenna connector.

The antenna design meets the requirements of the rules.

Radiated Emissions Spectrum Analyzer Bandwidth and Measurement Time - Peak Scan				
Frequency Band Start (MHz)	Frequency Band Stop (MHz)	6 dB Bandwidth (kHz)	Number of Ranges Used	Measurement Time per Range
0.009	0.15	0.3	2	Multiple Sweeps
0.15	30	9	6	Multiple Sweeps
30	1000	120	2	Multiple 800 mS Sweeps
1000	6000	1000	2	Multiple Sweeps
6000	18000	300	2	Multiple Sweeps
*Notes:				
1. The settings above are specifically calculated for the E4440A series of spectrum analyzers, which have 8,000 data points per range.				
2. The measurement receiver resolution bandwidth setting was 300 Hz for quasi-peak measurements from 9-150 kHz.				
3. The measurement receiver resolution bandwidth setting was 9 kHz for quasi-peak measurements from 0.15-30 MHz.				
4. The measurement receiver resolution bandwidth setting was 120 kHz for quasi-peak measurements from 30-1000 MHz.				
5. The measurement receiver resolution bandwidth setting was 1 MHz for average measurements from 1-18 GHz.				

Appendix: Policy, Rationale, and Evaluation of EMC Measurement Uncertainty

All uncertainty calculations, estimates and expressions thereof shall be in accordance with NIST policy. Since PTI operates in accordance with NIST (NVLAP) Handbook 150-11: 2007, all instrumentation having an effect on the accuracy or validity of tests shall be periodically calibrated or verified traceable to national standards by a competent calibration laboratory. The certificates of calibration or verification on this instrumentation shall include estimates of uncertainty as required by NIST Handbook 150-11.

1. Rationale and Summary of Expanded Uncertainty.

Each piece of instrumentation at PTI that is used in making measurements for determining conformance to a standard (or limit), shall be assessed to evaluate its contribution to the overall uncertainty of the measurement in which it is used. The assessment of each item will be based on either a type A evaluation or a type B evaluation. Most of the evaluations will be type B, since they will be based on the manufacturer's statements or specifications of the calibration tolerances, or uncertainty will be stated along with a brief rationale for the type of evaluation and the resulting stated uncertainties.

The individual uncertainties included in the combined standard uncertainty for a specific test result will depend on the configuration in which the item of instrumentation is used. The combination will always be based on the law of propagation of uncertainty. Any systematic effects will be accommodated by including their uncertainties, in the calculation of the combined standard uncertainty; except that if the direction and amount of the systematic effect cannot be determined and separated from its uncertainty, the whole effect will be treated as uncertainty and combined along with the other elements of the test setup.

Type A evaluations of standard uncertainty will usually be based on calculating the standard deviation of the mean of a series of independent observations, but may be based on a least-squares curve fit or the analysis of variance for unusual situations. Type B evaluations of standard uncertainty will usually be based on manufacturer's specifications, data provided in calibration reports, and experience. The type of probability distribution used (normal, rectangular, a priori, or u-shaped) will be stated for each Type B evaluation.

In the evaluation of the uncertainty of each type of measurement, the uncertainty caused by the operator will be estimated. One notable operator contribution to measurement uncertainty is the manipulation of cables to maximize the measured values of radiated emissions. The operator contribution to measurement uncertainty is evaluated by having several operators independently repeat the same test. This results in a Type A evaluation of operator-contributed measurement uncertainty.

A summary of the expanded uncertainties of PTI measurements is shown as Table 1. These are the worst-case uncertainties considering all operative influence factors.

Table 1: Summary of Measurement Uncertainties for Site 45

Type of Measurement	Frequency Range	Meas. Dist.	Expanded Uncertainty U, dB (k=2)
Mains Conducted Emissions	150 kHz to 30 MHz	N/A	2.9
Telecom Conducted Emissions	150 kHz to 30 MHz	N/A	2.8
Radiated Emissions	30 to 1,000 MHz	10 m	4.8
	1 to 18 GHz	3 m	5.7
