Test Summary

Purpose of Test

The purpose of the tests in this report is to demonstrate the compliance of the RFID, reader CS-461, with partial re-testing for FCC part 15 Subpart C sections 15.209 and 15.247 after component changes in the EUT. The following tests were performed to show compliance.

Voltage Variations

Result: Pass

Conducted Peak Output Power

Result: Pass

Spurious Conducted RF power

General Product Information

Product Function and Intended Use

The equipment under test (EUT) CS-461 RFID reader is an EPCglobal Class 1 Gen 2 certified fixed reader providing real-time tag processing for Class 1 (Read / Write) EPC- compliant tag. The system output power is selectable from 15dBm to 30dBm and operates in the 902 to 928MHz frequency band.

Ratings and System Details

FCC ID	:	UB4CS461C1GEN2
Operating Frequency	:	902.75MHz to 927.25MHz
No. of RF channel	:	50 channels
Channel Spacing	:	500kHz
Antenna	:	CS-771 Mono-static antenna (Detail antenna specification refer to appendix 6)
Power supply	:	AC/DC adapter: Brand: CUI Inc Model: DSA-60W-DB Input: 100-240Vac, 50-60Hz, 1.5A Output: +24V, 2.5A
Port(s)	:	(i) Ethernet port (ii) TNC Reverse Jack (Female) RF port x 4 (iii) DC input port (iv) RS232 serial port (v) DB 25

Operation Descriptions

The RFID reader hops among 50 channels from 902.75MHz to 927.25MHz in 500kHz steps in operating mode according to a generated pseudo-random sequence. The time of occupancy on each frequency is 0.2 seconds maximum within a 10 second period.

Each CS-461 reader hops among its 50 available channels according to an independently generated pseudo-random sequence. The reader maintains no capability to coordinate RF channel occupancy among separate units. Within each hop, the RFID reader may be sending command to the tag or receiving backscatter from the tag, alternating between them as required by the EPC Gen 2 protocol. When the reader is sending command to the tag, the reader is sending out modulated signal. When the reader is receiving backscatter from the tag, the reader is sending out continuous wave signal.

There are four bi-directional antenna ports (ANT1 – ANT4) that are multiplexed via 4-way RF switch circuit to the internal TX and RX path. The system will time multiplex among the selected ports if more than one port are selected. The power measured at the port can be adjusted from 15dBm to maximum 30dBm.

The system supports four preset profiles of operational configurations that are high throughput mode, medium throughput mode, and two dense reader modes. The details of the settings of each profile are shown in table:

Profile	Tari	PIE	Forward Link	Pulse Width	Link Frequency	Reverse Modulation	Mode
0	7.14	1.5:1	PR-ASK	Long	640 kbps	FM0	High Throughput
1	12.5	1.5:1	PR-ASK	Short	160 kbps	FM0	Medium Throughput
2	25	2:1	PR-ASK	Long	256 kbps	Miller, M=4	Dense Reader 1
3	25	2:1	PR-ASK	Long	256 kbps	Miller, M=8	Dense Reader 2

Glossary:

Tari: time interval of symbol 0

PIE: pulse interval encoding ratio of time span of Symbol 1 to Symbol 0 signal

Forward Link: modulation method of reader to tag link

Pulse Width: time width of RF pulse at power below average power level

Link Frequency: data rate of tag to reader link

Reverse Modulation: Encoding method of the tag to reader link (either FM0 or Miller subcarrier)

Test Set-up and Operation Mode

Principle of Configuration Selection

Emission: The test was performed under test mode to obtain the maximum emissions.

Test Operation and Test Software

Testing software was used to enable the continuous transmission on the EUT for the tests in this report.

Special Accessories and Auxiliary Equipment

The EUT was tested together with the following additional accessory:

- Notebook computer

Countermeasures to achieve EMC Compliance

- none

Test Methodology

Radiated Emission Test

The radiated emission measurement was performed according to the procedures in ANSI C63.4-2003. The equipment under test (EUT) was placed at the middle of the 80 cm high turntable and all four antenna ports were connected with the dedicated antennas (model:CS-771), and the EUT is 3 meters far from the measuring antenna. The turntable was rotated 360° for obtaining the maximum emission. The height of the measuring antennas was scanned between 1m and 4m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained. The measurement above 1000MHz was performed by horn antenna. The measurement below 30MHz was performed by loop antenna, maximum emission was obtained by two antenna polarizations of loop faced and sided to the EUT. maximum emission was obtained by two antenna polarizations of loop faced and sided to the EUT.

Conducted Emission Test on a.c. mains line

The equipment under test (EUT) was placed on a wooden table 80cm above the ground plane, the LISN was placed 80cm away from the EUT. The test was performed in accordance with ANSI C63.4: 2003, with the following: an initial measurement was performed in peak and average detection mode on the live and neutral lines. The pre-scan was performed by peak detection on both live and neutral conductors. Any emissions recorded within 20dB of the relevant limit line were re-measured using quasi-peak and average detections, the 6 worst cases was recorded in the table of results.

Test Results

Voltage Variations

Section 15.31(e)

RESULT:**Pass**

Test Specification : FCC Part 15 Section 15.31(e) & 15.247(b) (2)

Limit of section 15.207:

Frequency of emission (MHz)	QP Limit (dBµV)	AV Limit (dBµV/m)
0.15 – 0.5	66 – 56*	56 – 46*
0.5 – 5	56	46
5 – 30	60	50

* Decreases with the logarithm of the frequency.

Spurious Radiated Emissions**Section 15.209****RESULT:****Pass**

Test Specification : FCC Part 15 Section 15.205, 15.209 & 15.247(d)
 Test Method : ANSI C63.4-2003
 Measurement Location : Semi Anechoic Chamber
 Supply Voltage : 100Va.c.
 Measuring Frequency Range : 30kHz (Lowest internal oscillator frequency of 32.768kHz) – 10GHz(Up to 10th harmonic of the highest fundamental frequency)
 Measuring Distance : 3m
 Antennas connected on EUT : All four antennas were connected to port 1- 4 during the test
 Detection : QP for frequency below 1GHz, Peak for frequency above 1GHz
 Transmit profile type : 0
 Requirement : In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. Attenuation below the general limits specified in Sections 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a).

Fundamental Carrier Signal (MHz)	Antenna Polarization	Spurious Emission (MHz)	Field Strength at 3m (dBµV/m)	Limit (dBµV/m)	Margin (dB)
902.75	V	1194.4	43.4	54	-10.6
	V	2708.4	45.3	54	-8.7
	H	988.5	45.8	54	-8.2
	H	1148.5	36.5	54	-17.5
	H	2708.2	44.8	54	-9.2
915.25	V	965.6	44.7	54	-9.3
	V	1195.7	44.4	54	-9.6
	V	1598.0	38.9	54	-15.1
	V	2745.7	44.6	54	-9.4
	H	2745.8	43.3	54	-10.7
927.25	V	1196.8	46.2	54	-7.8
	H	2204.0	35.8	54	-18.2

Remark: Transmit profile 0 (highest link frequency) was chosen for the test.

Limit for Radiated Emission of Section 15.209:

Frequency (MHz)	Field strength (dB μ V) at 3m range	Field strength (dB μ V/m) at 3m range
1.705-30	30 (30m range)*	29.5(30m range)*
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
Above 960	500	54.0

Remark: * the limit shows in the table above of frequency range 1.705-30MHz are at 30 meter range, which is correspond to 49.5dB μ V/m at 3m range by extrapolation calculation and the measurement of loop antenna.

The emission limits shows in the above table are based on measurements employing a CISPR quasi-peak detector and above 1000 MHz are based on the measurements employing an average detector.

20dB Bandwidth Occupancy

Section 15.247(a)(1)(i)

RESULT:

Pass

Test Specification : FCC Part 15 Section 15.31
 Detector Function : Peak
 Supply Voltage : 100V a.c.
 Port of testing : Antenna port 1
 Transmit profile type : 0 [Transmit profile 0 (highest link frequency) was chosen for the test.]
 Requirement : If the 20dB bandwidth of the hopping channel is 250kHz or greater, the system shall use at least 25 hopping frequency and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 sec period. The maximum allowed 20dB bandwidth of the hopping channel is 500kHz.

Results:
