## MEASUREMENT REPORT

### 1.1 Scope

Measurement and determination of electromagnetic emissions (EME) of radio frequency devices including intentional and/or unintentional radiators for compliance with the technical rules and regulations of the Federal Communications Commission.

## 2.1 INTRODUCTION

The measurement procedure described in American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40GHz (ANSI C63.4-2003) was used in determining radiated and conducted emissions emanating from **CEYON TECHNOLOGY CO., LTD. RFID READER/WRITER. FCC ID:UDCWIM125-S**  
**Model : WIM 125-S**

The open area test site and conducted measurement facility used to collect the radiated data are located at the 254-1, MAEKOK-RI, HOBUP-MYUN, ICHON-SI, KYOUNGKI-DO, 467-701, KOREA. The site is constructed in conformance with the requirements of ANSI C63.4 and CISPR Publication 22. Detailed description of test facility was submitted to the Commission and accepted dated July 05, 2006 (Confirmation Number: EA90661)

## 3.1 PRODUCT INFORMATION

### 3.2 Equipment Description

Equipment Under Test (EUT) is CEYON TECHNOLOGY CO., LTD. RFID READER/WRITER.  
 FCC ID: UDCWIM125-S (Model : WIM 125-S)

#### 1.1.2. Environment Specifications

| Item                                 | Specifications          |
|--------------------------------------|-------------------------|
| Operation temperature range          | 0°C to +65°C            |
| Operation humidity range             | 20 % ~ 90 % (No dewing) |
| Operation atmospheric pressure range | 1 atmospheric pressure  |
| Conservation temperature range       | 0°C to +80°C            |
| Conservation humidity range          | 20 % ~ 90 % (No dewing) |

## 4.1 Description of Tests(Conducted)

### 4.2 Powerline Conducted RFI (150kHz- 30MHz)

The power line conducted RFI measurements were performed according to CISPR 22.

The EUT was placed on a non-conducting 1.0 by 1.5 meter table which is 0.8 meters in height and 0.40 meters away from the vertical wall of the shielded enclosure. Power to the EUT is provided through a Rohde & Schwarz 50  $\Omega$  / 50  $\mu$ H Line Impedance Stabilization Network (LISN) and the support equipment through a separate Solar 50  $\Omega$  / 50  $\mu$ H Line- Conducted Test Facility LISN. Sufficient time for the EUT, support equipment, and test equipment were allowed in order for them to warm up to their normal operating condition. The RF output of the LISN was connected to the spectrum analyzer to determine the frequency producing the maximum EME. The spectrum was scanned from 150kHz to 30 MHz. Each maximum EME was remeasured using an EMI receiver. The detector function of the receiver was set to CISPR quasi- peak and average mode with the bandwidth set to 9 kHz. Each emission was maximized consistent with the typical applications by varying the configuration of the test sample. Interface cables were connected to the available interface ports of the test unit. The effect of varying the position of cables was investigated to find the configuration that produces maximum Diagram emission. Excess cable lengths were bundled at the center with 30- 40cm. in length. The worst-case configuration is noted in the test report and the photographs are attached.

| RFI CONDUCTED                                               | CISPR 22 CLASS B       |                     |

Table 1. RFI Conducted Limits

## 4.3 TRANSMITTER RADIATED SPURIOUS EMISSIONS (<30 MHz)

### LIMITS

§15.029 (a) Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table :

| Frequency<br>(MHz) | Field Strength<br>(microvolts/meter) | Measurement Distance<br>(meters) |
|--------------------|--------------------------------------|----------------------------------|
| 0.009-0.490        | 2400/F (kHz)                         | 300                              |
| 0.490-1.750        | 24000F (kHz)                         | 30                               |
| 1.705-30.0         | 30                                   | 30                               |
| 30-88              | 100**                                | 3                                |
| 88-216             | 150**                                | 3                                |
| 216-960            | 200**                                | 3                                |
| Above960           | 500                                  | 3                                |

**Table 2. RFI Radiated Limits**

\*\*Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this Section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this Part, e.g., Sections 15.231 and 15.241.

§15.209 (b) In the emission table above, the tighter limit applies at the band edges.

§15.209 (d) The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz.

Radiated emission limits in these three bands are based on measurements employing an average detector.

### TEST PROCEDURE

The EUT is tested on the Open Area Test Site. The antenna to EUT distance is 10 meters. The EUT is configured in accordance with ANSI C63.4. The EUT is set to transmit in a continuous mode.

For measurements below 150 kHz the resolution bandwidth is set to 3 kHz, or 200 Hz CISPR 6 dB for peak detection measurements or VBW=10 Hz for average detection measurements. Peak detection is used unless otherwise noted as quasi-peak.

For measurements above 150 kHz the resolution bandwidth is set to 90 kHz, or 10 kHz CISPR 6 dB for

peak detection measurements. Peak detection is used unless otherwise noted as quasi-peak.

The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The EUT is rotated through 360 degrees to maximize missions received. The center of the loop antenna is fixed at 3 meter above the field. Measurements are made with the antenna polarized in both the Face-On and The face-Off positions.

## 4.4 PRELIMINARY TESTS

### 4.5 Radiated Emission Test

During Tests, the following operating conditions were investigated

| Axes | The worst operating condition |
|------|-------------------------------|
| X    |                               |
| Y    | O                             |
| Z    |                               |

Note : This transmitter has been investigated with three axes and the reported readings are the worse case.

Radiated Measurements at 3-meters.

NOTES:

1. All modes of operation were investigated, and the worst-case emissions are reported(Page 18).
2. The radiated limits are listed on Table 2 (Page 7).

\*\*\* Measurements using CISPR quasi-peak mode. Above 1GHz, peak detector function mode is used using a resolution bandwidth of 1MHz and a video bandwidth of 1MHz. The peak level complies with the average limit. Peak mode is used with linearly polarized horn antenna and low-loss microwave cable.

## 8.1 Sample Calculations

### 8.2 Example 1:

**@ 4.015 MHz**

|               |                                       |
|---------------|---------------------------------------|
| Class B limit | = 46.0 dB $\mu$ V                     |
| Reading       | = 40.05 dB $\mu$ V (calibrated level) |

|               |                                   |
|---------------|-----------------------------------|
| <b>Margin</b> | = 40.05 – 46.0 = -5.95 dB $\mu$ V |
|               | = <b>5.95 dB below limit</b>      |

### 8.3 Example 2:

Result Level = Level + T.F – Distance Correction Factor

T.F = Antenna Factor + Cable loss

Distance Correction Factor=40 log(specific distance / test distance)

### 8.4 Example 3:

**@166.5 MHz**

|                             |                                        |
|-----------------------------|----------------------------------------|
| Class B limit               | = 43.5 dB $\mu$ V/m                    |
| Reading                     | = 23.3 dB $\mu$ V/m (calibrated level) |
| Antenna Factor + Cable Loss | = 15.2 dB                              |
| Total                       | = 38.5 dB $\mu$ V/m                    |

|               |                                  |
|---------------|----------------------------------|
| <b>Margin</b> | = 43.5 – 38.5 = 5.0 dB $\mu$ V/m |
|               | = <b>5.0 dB Under limit</b>      |

## 9.1 Test Equipment

| <u>Type</u>                 | <u>Manufacture</u> | <u>Model Number</u> | <u>CAL Due Date</u> |
|-----------------------------|--------------------|---------------------|---------------------|
| EMI Test Receiver           | Rohde & Schwarz    | ESI40               | 2006.11.16          |
| EMI Test Receiver           | Rohde & Schwarz    | ESCI                | 2007.08.24          |
| LISN                        | Rohde & Schwarz    | ESH2-Z5             | 2007.04.26          |
| LISN                        | EMCO               | 703125              | 2007.04.26          |
| Loop Antenna                | Rohde & Schwarz    | HFH2-Z2             | 2006.12.20          |
| TRILOG Antenna              | Schwarzbeck        | VULB 9160           | 2007.04.17          |
| Antenna Position Tower      | HD                 | MA240               | N/A                 |
| Turn Table                  | EMCO               | 1050                | N/A                 |
| Power Analyzer              | Voltech            | PM 3300             | 2007.03.22          |
| Reference Network Impedance | Voltech            | IEC 555             | N/A                 |
| AC Power Source             | PACIFIC            | Magnetic Module     | N/A                 |
| AC Power Source             | PACIFIC            | 360-AMX             | 2006.11.25          |
| Controller                  | HD GmbH            | HD 100              | N/A                 |
| SlideBar                    | HD GmbH            | KMS 560             | N/A                 |
| PULSE LIMITER               | Rohde & Schwarz    | ESH3-Z2             | 2007.10.30          |

## 10.1 Test Software Used

**The EUT should be in continuous transmitting mode.**

NOTE: This is a sample of the basic program used during the test. However, during testing, a different software program may be used; whichever determines the worst-case condition. In addition, the program used also depends on the number and type of devices being tested.

The device under test was operated during the measurement under following conditions:

- The EUT was operating the Maximum power at 125 kHz (Below 30 MHz)
- The EUT was operating the Maximum power at 125 kHz (30 MHz – 1GHz)
