

Regarding: SAR Report  
Reference page 10

Tester explains choice of EUT position, testing the facing side (as viewed by the user) of the EUT rather than the bottom. This is the closer position to the antenna locations than the bottom or lap side. This is evident by the battery pack location. (See drawings & photos in the SAR report.) The battery pack is under the top/center antenna such that the battery pack is between the antenna and the user lap. A taper in the tablet design affords a slightly lower spacing for the side antenna, though being mounted to the LCD frame like the other antenna it remains closer to the facing side than the bottom.
