

Test Report Serial Number:

45461430 R3.0

Test Report Date:

20 March 2018

Project Number:

1398

EMC Test Report - Class II Permissive Change

Applicant:

4RF Limited
PO Box 13-506
Wellington, New Zealand 6440
New Zealand

FCC ID:

UIPSQ215M141

Product Model Number / HVIN

Aprisa SR

Aprisa SR+

IC Registration Number

-

Product Name / PMN

SX215M141

SQ215M141

In Accordance With:

FCC 47 CFR Part 80 - Automated Systems (AMTS)

Licensed Non-Broadcast Station Transmitter (TNB)

FCC 47 CFR Part 95 - Personal Radio Service

Subpart F - 218-219 MHz Serviced

Approved By:

Ben Hewson, President

Celltech Labs Inc.

21-364 Lougheed Rd.

Kelowna, BC, V1X 7R8

Canada

Test Lab Certificate: 2470.01

**Industry
Canada**

IC Registration 3874A-1

FCC Registration: CA3874

2.0 CLIENT AND DUT INFORMATION

Client Information	
Applicant Name	4RF Limited
Applicant Address	PO Box 13-506 Wellington, New Zealand, 6440 New Zealand
DUT Information	
Device Identifier(s):	FCC ID: UIPSQ215M141
	ISED ID: -
Equipment Class:	TNB - Licensed Non-Broadcast Station Transmitter
Device Type:	Digital Radio
Device Model(s) / HVIN: (See Note 1)	SX215M141
	SQ215M141
Device Marketing Name / PMN:	Aprisa SR
	Aprisa SR+
Firmware Version ID Number / FVIN:	-
Host Marketing Name / HMN:	-
Test Sample Serial No.:	T/A Sample - Identical Prototype
Transmit Frequency Range:	§80.385 AMTS Group D: 216.0125 - 216.4875MHz
	§80.385 AMTS Group C: 216.5125 - 216.9875MHz
	§80.385 AMTS Group B: 217.0125 - 217.4875MHz & 219.0125 - 219.4875MHz
	§80.385 AMTS Group A: 217.5125 - 217.9875MHz & 219.5125 - 219.9875MHz
	§90.853 Segment A: 218.000-218.500MHz
	§90.853 Segment B: 218.501-219.00MHz
Test Channels:	Programmable
Manuf. Max. Rated Output Power:	QPSK: 37dBm
	16 QAM: 35dBm
	64 QAM: 34dBm
Manuf. Max. Rated BW/Data Rate:	12.5kHz, 25kHz
Antenna Make and Model:	n/a
Antenna Type and Gain:	External, 0dBi nominal (15dBi maximum).
Modulation:	QPSK, 16QAM, 64QAM
Mode:	Half Duplex
Emission Designator:	See Section 8.0
DUT Power Source:	13.8 VDC External (Nominal)
DUT Dimensions [HxWxD] (mm)	90 x 432 x 280
Deviation(s) from standard/procedure:	None
Modification of DUT:	None

Note 1: This is a Class II Permissive Change. The SR and SR+ variants are same and identical units in all aspects of the RF Transmitter circuitry and form factor to that of the original filing. . The SR is a feature reduced variant capable of QPSK only, no receive antenna and slight enclosure modifications. Both variants were evaluated for frequency stability and Rx spurious emissions. This Class II Permissive Change is to add Channel Groups A, B, C and D per §80.385 (AMTS) and Channel Segments A and B per §95.1953. These changes are accomplished via software without any hardware changes in any manner.

3.0 SCOPE

This Certification Report was prepared on behalf of:

4RF Limited

,(the '*Applicant*'), in accordance with the applicable Federal Communications Commission (FCC) CFR 47 rules parts and regulations (the '*Rules*'). The scope of this investigation was limited to only the equipment, devices and accessories (the '*Equipment*') supplied by the *Applicant*. The tests and measurements performed on this *Equipment* were only those set forth in the applicable *Rules* and/or the Test and Measurement Standards they reference. The *Rules* applied and the Test and Measurement Standards used during this evaluation appear in the Normative References section of this report. The limits set forth in the technical requirements of the applicable *Rules* were applied to the measurement results obtained during this evaluation and ,unless otherwise noted, these limits were used as the Pass/Fail criteria. The Pass/Fail statements made in this report apply to only the tests and measurements performed on only the *Equipment* tested during this evaluation. Where applicable and permissible, information including test and measurement data and/or results from previous evaluations of same or similar equipment, devices and/or accessories may be cited in this report.

As per FCC CFR 47 Part §2.1091 and §2.1093, an RF Exposure evaluation report is required for this *Equipment* and the results of the RF Exposure evaluation appear in a separate exhibit from this report.

This *Equipment* is subject to FCC Declaration of Conformity (DoC). DoC evaluations were performed on this *Equipment* and the results of the DoC evaluation appear in a separate exhibit from this report.

4.0 TEST SUMMARY

TEST SUMMARY					
Section	Description of Test	Procedure Reference	Applicable Rule Part(s) FCC	Test Date	Result
7.0	Conducted Power (Fundamental)	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1046 §80.215(h)(5) §95.1955	20 - 21 Feb 2018	Pass
8.0	Occupied Bandwidth	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1049	20 Feb 2018	Pass
9.0	Emission Mask (Out of Band)	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1049 §80.211(c)	23 Feb 2018	Pass
10.0	Band Edge and Conducted Tx Spurious Emissions	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1049 §80.211(f) §80.481	20 - 21 Feb 2018	Pass
11.0	Band Edge	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1049 §95.1957	23 Feb 2018 12 Mar 2018	Pass
12.0	Conducted Tx Spurious Emissions	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1051 §95.1957	23 Feb 2018	Pass
13.0	Conducted Tx Spurious Emissions to 10th Harmonic	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1051 §80.211(f) §95.1957(d)	23 Feb 2018	Pass
14.0	Radiated Tx Spurious Emissions	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1053 §80.211(f) §95.1957	27 Feb 2018	Pass
15.0	Frequency Stability	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§2.1055 §80.209(a)(6)	26 Feb 2018	Pass
16.0	Radiated Rx Spurious Emissions	ANSI/TIA/EIA-603-E-2016 ANSI C63.4:2014	§15B	27 Feb 2018	Pass

I attest that the data reported herein is true and accurate within the tolerance of the Measurement Instrument Uncertainty; that all tests and measurements were performed in accordance with accepted practices or procedures; and that all tests and measurements were performed by me or by trained personnel under my direct supervision. The results of this investigation are based solely on the test sample(s) provided by the client which were not adjusted, modified or altered in any manner whatsoever, except as required to carry out specific tests or measurements. This test report has been completed in accordance with ISO/IEC 17025.

6.0 FACILITIES AND ACCREDITATIONS

Facility and Accreditation:

The facilities used to evaluate this device outlined in this report are located at 21-364 Lougheed Road, Kelowna, British Columbia, Canada V1X 7R8. The radiated emissions site (OATS) conforms to the requirements set forth in ANSI C63.4 and is filed and listed with the FCC under Test Firm Registration Number CA3874 and Industry Canada under Test Site File Number IC 3874A-1. Celltech is accredited to ISO 17025, through accrediting body A2LA and with certificate 2470.01.

7.0 CONDUCTED POWER

Test Procedure

Normative Reference	FCC 47 CFR §2.1046, §80.215(h)(5), §95.1955
----------------------------	---

Limits

47 CFR §80.215	§ 80.215 Transmitter Power (h) Coast stations in an AMTS may radiate as follows, subject to the condition that no harmful interference will be caused to television reception except that TV services authorized subsequent to the filing of the AMTS station application will not be protected. (5) The transmitter power, as measured at the input terminals to the station antenna, must be 50 watts or less.
47 CFR §95.1955	No CTS or fixed RTU may transmit with an ERP exceeding 20 watts.

Test Setup	Appendix A	Figure A.1
-------------------	-------------------	-------------------

Measurement Procedure

The DUT was connected to a Spectrum Analyzer (SA) via a 30dB attenuator connected to the DUT's antenna port. The SA Detector was set to Max Peak with the RBW set to $\geq$ the OBW of the DUT. The output power of the DUT was set to the manufacturer's highest rated setting for each modulation type and to the center frequency of each transmission band. All modulations (QPSK, 16 QAM, and 64 QAM) and all bandwidths (12.5kHz and 25kHz) were investigated.

ERP (dBm) = E_{Meas} + G - 2.15

Margin = Limit - ERP in dB

Applicant Attestation Regarding Antenna Gain:

The maximum antenna gain in the manual does not consider regulatory requirements as it is there for exposure calculation only.

As the Aprisa SR+ is installed by professionals the TX power should be reduced at installation if using a higher gain antenna (typically at the remote site) to ensure that the license conditions are adhered to.

This is covered explicitly in the user manual under “Compliance General” which states:

The Aprisa SR+ radio predominantly operates within frequency bands that require a site license be issued by the radio regulatory authority with jurisdiction over the territory in which the equipment is being operated. It is the responsibility of the user, before operating the equipment, to ensure that where required the appropriate license has been granted and all conditions attendant to that license have been met.

Adjustment of the TX power is included in our product for exactly this reason.

Typically the Base station will have an omni directional antenna and the Remotes will have small directional antenna.

The ability to adjust the TX power at the remotes to ensures EIRP requirements are met also improves frequency reuse that may not be possible if directional (i.e. higher gain) antennas were not used.

Consideration in setting the TX power must also be given to the modulation used and feeder loss.

9.0 COMPLIANCE TO §80.211(C)

Test Conditions

Normative Reference	FCC 47 CFR §2.1046, §80.211(c), KDB 971168 D01v02r02
----------------------------	---

Limits

§ 80.211 Emission limitations

(c) In any 4 kHz band the peak power of spurious emissions and noise at the input to the transmit antenna must be attenuated below the peak output power of the station as follows:

- (1) 125 dB at 1525.0 MHz, increasing linearly to 90 dB at 1612.5 MHz;
- (3) 90 dB from 1624.0 MHz to 1650.0 MHz, except at frequencies near the transmitted carrier where the requirements of paragraphs (b)(1) through (3) of this section, apply;
- (4) 60 dB at 1650.0 MHz decreasing linearly to 90 dB at 1662.5 MHz;
- (5) 90 dB at 1662.5 MHz decreasing linearly to 125 dB at 1752.5 MHz; and
- (6) 125 dB outside above range, except for harmonics which must comply with (b)(3) of this section.

47 CFR §80.211(c)

Test Setup

Appendix A

Figure A.2

Measurement Procedure

The DUT was connected to a Spectrum Analyzer (SA) via the DUT's antenna port using a high-pass filter to filter out the carrier. The SA Detector was set to Max Peak. The output power of the DUT was set to the manufacturer's highest rated setting. To determine compliance an emission mask was created in accordance with the above requirements referenced to the carrier, or dBc. The DUT frequency was set a frequency which would produce a harmonic at the frequency of the worst case attenuation criteria from above. The emission was measured with minimum *attenuation* referenced to the carrier, dBc.

10.0 §80.211(F) AND §80.481 BAND EDGE COMPLIANCE

Test Procedure

Normative Reference	FCC 47 CFR §2.1046, §80.211(f), §80.481
----------------------------	---

Limits

47 CFR §80.211	§ 80.211 Emission Limitations (f) The mean power when using emissions other than those in paragraphs (a), (b), (c) and (d) of this section: (1) On any frequency removed from the assigned frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: At least 25 dB; (2) On any frequency removed from the assigned frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: At least 35 dB; and (3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least 43 plus 10log10 (mean power in watts) dB.
	47 CFR §80.481 In lieu of the technical parameters set forth in this part, AMTS transmitters may utilize any modulation or channelization scheme so long as emissions are attenuated in accordance with §80.211 at the band edges of each station's assigned channel group or groups.

Test Setup

Appendix A	Figure A.1
------------	------------

Measurement Procedure

The DUT was connected to a Spectrum Analyzer (SA) via a 30dB attenuator connected to the DUT's antenna port. The SA Detector was set to RMS with the RBW set to $\leq$ the OBW of the DUT. The output power of the DUT was set to the manufacturer's highest rated setting for each modulation type. The DUT frequency was set to the lowest and highest channel setting in each channel Group. All modulations (QPSK, 16 QAM, and 64 QAM) and all bandwidths (12.5kHz and 25kHz) were investigated. An emission mask of the above limits was used to determine compliance.

Plot 10.1 – Band Edge, Coast Channel Group D, Lower Channel, 216.0125MHz, 25kHz BW, QPSK

Plot 10.2 – Band Edge, Coast Channel Group D, Lower Channel, 216.0125MHz, 25kHz BW, 16QAM

Plot 10.3 – Band Edge, Coast Channel Group D, Lower Channel, 216.0125MHz, 25kHz BW, 64QAM

Plot 10.4 – Band Edge, Coast Channel Group D, Upper Channel, 216.4875MHz, 25kHz BW, QPSK

Plot 10.5 – Band Edge, Coast Channel Group D, Upper Channel, 216.4875MHz, 25kHz BW, 16QAM

Plot 10.6 – Band Edge, Coast Channel Group D, Upper Channel, 216.4875MHz, 25kHz BW, 64QAM

Plot 10.7 – Band Edge, Coast Channel Group D, Lower Channel, 216.0125MHz, 12.5kHz BW, QPSK

Plot 10.8 – Band Edge, Coast Channel Group D, Lower Channel, 216.0125MHz, 12.5kHz BW, QPSK

It is demonstrated that since all modulations of the DUT's 25kHz Channel Bandwidth are compliant that all modulations of the DUT's 12.5kHz Channel Bandwidth will be compliant.

Plot 10.9 – Band Edge, Coast Channel Group C, Lower Channel, 216.5125MHz, 25kHz BW, QPSK

Plot 10.10 – Band Edge, Coast Channel Group C, Lower Channel, 216.5125MHz, 25kHz BW, 16QAM

Plot 10.11 – Band Edge, Coast Channel Group C, Lower Channel, 216.5125MHz, 25kHz BW, 64QAM

Plot 10.12 – Band Edge, Coast Channel Group C, Upper Channel, 216.9875MHz, 25kHz BW, QPSK

Plot 10.13 – Band Edge, Coast Channel Group C, Upper Channel, 216.9875MHz, 25kHz BW, 16QAM

Plot 10.14 – Band Edge, Coast Channel Group C, Upper Channel, 216.9875MHz, 25kHz BW, 64QAM

Plot 10.15 – Band Edge, Coast Channel Group C, Lower Channel, 216.5125MHz, 12.5kHz BW, QPSK

Plot 10.16 – Band Edge, Coast Channel Group C, Upper Channel, 216.9875MHz, 12.5kHz BW, QPSK

It is demonstrated that since all modulations of the DUT's 25kHz Channel Bandwidth are compliant that all modulations of the DUT's 12.5kHz Channel Bandwidth will be compliant.

Plot 10.17 – Band Edge, Coast Channel Group B, Lower Channel, 217.0125MHz, 25kHz BW, QPSK

Plot 10.48 – Band Edge, Ship Channel Group A, Upper Channel, 219.9875MHz, 12.5kHz BW, QPSK

It is demonstrated that since all modulations of the DUT's 25kHz Channel Bandwidth are compliant that all modulations of the DUT's 12.5kHz Channel Bandwidth will be compliant.

11.0 BAND EDGE COMPLIANCE TO §95.1957

Test Procedure

Normative Reference FCC 47 CFR §2.1046, §95.1957

Limits

47 CFR §95.1957	§ 95.1957 Emission Standards (a) All transmissions by each CTS and by each RTU shall use an emission type that complies with the following standard for unnecessary radiation. (b) All spurious and out-of-band emissions shall be attenuated: (1) Zero dB on any frequency within the authorized frequency segment. (2) At least 28 dB on any frequency removed from the midpoint of the assigned frequency segment by more than 250 kHz up to and including 750 kHz; (3) At least 35 dB on any frequency removed from the midpoint of the assigned frequency segment by more than 750 kHz up to and including 1250 kHz; (4) At least 43 plus 10 log (base 10) (mean power in Watts) dB on any frequency removed from the midpoint of the assigned frequency segment by more than 1250 kHz. (c) When testing for certification, all measurements of unnecessary radiation are performed using a carrier frequency as close to the edge of the authorized frequency segment as the transmitter is designed to be capable of operating. (d) The reference bandwidth of the instrumentation used to measure the emission power shall be 100 Hz for measuring emissions up to and including 250 kHz from the edge of the authorized frequency segment, and 10 kHz for measuring emissions more than 250 kHz from the edge of the authorized frequency segment. If a video filter is used, its bandwidth shall not be less than the reference bandwidth. The power level of the highest emission within the frequency segment, to which the attenuation is referenced, shall be remeasured for each change in reference bandwidth.
-----------------	---

Test Setup

Appendix A **Figure A.1**

Measurement Procedure

The DUT was connected to a Spectrum Analyzer (SA) via a 30dB attenuator connected to the DUT's antenna port. The SA Detector was set to RMS.

For emissions at the band's edge, the SA RBW set to 100Hz and the emissions were compare to an emissions mask as described above. The emissions mask was set to the peak output level of the transmission. The DUT frequency was set as close to the band edge as capable. All transmission modes (QPSK, 16QAM and 64QAM) and channel bandwidths (12.5kHz and 50kHz) were evaluated. A marker indicates the emissions level at the band's edge.

For emissions greater than 250kHz from the band's edge, the SA RBW set to 10kHz and the emissions (Trace 2) were compare to an emissions mask as described above. The emissions mask was set to the peak output level of the transmission (Trace 1), measured with an RBW of 10kHz. The DUT frequency was set as close to the band edge as capable. All transmission modes (QPSK, 16QAM and 64QAM) and channel bandwidths (12.5kHz and 50kHz) were evaluated.

12.0 CONDUCTED SPURIOUS EMISSIONS §95.1957

Test Procedure

Normative Reference	FCC 47 CFR §2.1046, §95.1957
----------------------------	------------------------------

Limits

47 CFR §95.1957	§ 95.1957 Emission Standards
	(a) All transmissions by each CTS and by each RTU shall use an emission type that complies with the following standard for unnecessary radiation. (b) All spurious and out-of-band emissions shall be attenuated: (1) Zero dB on any frequency within the authorized frequency segment. (2) At least 28 dB on any frequency removed from the midpoint of the assigned frequency segment by more than 250 kHz up to and including 750 kHz; (3) At least 35 dB on any frequency removed from the midpoint of the assigned frequency segment by more than 750 kHz up to and including 1250 kHz; (4) At least 43 plus 10 log (base 10) (mean power in Watts) dB on any frequency removed from the midpoint of the assigned frequency segment by more than 1250 kHz. (c) When testing for certification, all measurements of unnecessary radiation are performed using a carrier frequency as close to the edge of the authorized frequency segment as the transmitter is designed to be capable of operating. (d) The reference bandwidth of the instrumentation used to measure the emission power shall be 100 Hz for measuring emissions up to and including 250 kHz from the edge of the authorized frequency segment, and 10 kHz for measuring emissions more than 250 kHz from the edge of the authorized frequency segment. If a video filter is used, its bandwidth shall not be less than the reference bandwidth. The power level of the highest emission within the frequency segment, to which the attenuation is referenced, shall be remeasured for each change in reference bandwidth.

Test Setup

Appendix A	Figure A.1
-------------------	-------------------

Measurement Procedure

The DUT was connected to a Spectrum Analyzer (SA) via a 30dB attenuator connected to the DUT's antenna port. The SA Detector was set to RMS.

For emissions at the band's edge, the SA RBW set to 100Hz and the emissions were compare to an emissions mask as described above. The emissions mask was set to the peak output level of the transmission. The DUT frequency was set as close to the band edge as capable. All transmission modes (QPSK, 16QAM and 64QAM) and channel bandwidths (12.5kHz and 50kHz) were evaluated. A marker indicates the emissions level at the band's edge.

For emissions greater than 250kHz from the band's edge, the SA RBW set to 10kHz and the emissions (Trace 2) were compare to an emissions mask as described above. The emissions mask was set to the peak output level of the transmission (Trace 1), measured with an RBW of 10kHz. The DUT frequency was set as close to the band edge as capable. All transmission modes (QPSK, 16QAM and 64QAM) and channel bandwidths (12.5kHz and 50kHz) were evaluated.

----------------------------	--

Limits

47 CFR §80.211	§ 80.211 Emission Limitations (f) The mean power when using emissions other than those in paragraphs (a), (b), (c) and (d) of this section: (1) On any frequency removed from the assigned frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: At least 25 dB; (2) On any frequency removed from the assigned frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: At least 35 dB; and (3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least 43 plus 10log10 (mean power in watts) dB.
47 CFR §95.1957	§ 95.1957 Emission Standards (a) All transmissions by each CTS and by each RTU shall use an emission type that complies with the following standard for unnecessary radiation. (b) All spurious and out-of-band emissions shall be attenuated: (1) Zero dB on any frequency within the authorized frequency segment. (2) At least 28 dB on any frequency removed from the midpoint of the assigned frequency segment by more than 250 kHz up to and including 750 kHz; (3) At least 35 dB on any frequency removed from the midpoint of the assigned frequency segment by more than 750 kHz up to and including 1250 kHz; (4) At least 43 plus 10 log (base 10) (mean power in Watts) dB on any frequency removed from the midpoint of the assigned frequency segment by more than 1250 kHz. (c) When testing for certification, all measurements of unnecessary radiation are performed using a carrier frequency as close to the edge of the authorized frequency segment as the transmitter is designed to be capable of operating. (d) The reference bandwidth of the instrumentation used to measure the emission power shall be 100 Hz for measuring emissions up to and including 250 kHz from the edge of the authorized frequency segment, and 10 kHz for measuring emissions more than 250 kHz from the edge of the authorized frequency segment. If a video filter is used, its bandwidth shall not be less than the reference bandwidth. The power level of the highest emission within the frequency segment, to which the attenuation is referenced, shall be remeasured for each change in reference bandwidth.

Test Setup

Appendix A	Figure A.1
-------------------	-------------------

Measurement Procedure

The DUT was connected to a Spectrum Analyzer (SA) via a 30dB attenuator connected to the DUT's antenna port. The SA Detector was set to RMS with the RBW set to 10kHz. The output power of the DUT was set to the manufacturer's highest rated setting for QPSK Modulation. Emissions were investigate to the 10th harmonic.

If a video filter is used, its bandwidth shall not be less than the reference bandwidth. The power level of the highest emission within the frequency segment, to which the attenuation is referenced, shall be remeasured for each change in reference bandwidth.

Test Setup

Appendix A **Figure A.3, Figure A.4**

Measurement Procedure

Measurements Below 1GHz

The DUT and measurement equipment were setup in accordance with Figure A.3 in appendix A. The Scan range was from 200MHz to 1GHz. The scans were made with the antennas in the horizontal and vertical polarizations and from 1 to 4m elevation. The DUT was rotated 360 degrees.

Measurements Above 1GHz

The DUT and measurement equipment were setup in accordance with Figure A.4 in appendix A. The Scan range was from 1 to 3GHz. The scans were made with the antennas in the horizontal and vertical polarizations on a bore-sighted mast and from 1 to 4m elevation. The DUT was rotated 360 degrees.

					Vertical					-43.0
Results:									Complies	

$$\text{Attenuation [A]} = E_{\text{Meas}} - E_{\text{EM}}$$

$$\text{Margin} = [\text{A}] - \text{Limit}$$

No other emissions spurious emissions were observed.

15.0 FREQUENCY STABILITY

Test Conditions

Normative Reference	FCC 47 CFR §80.209(a)(6), §2.1055
----------------------------	-----------------------------------

Limits

47 CFR §80.209(a)(6)	§ 80.209 Transmitter Frequency Tolerances (a)(6)(i) Coast Stations: 5ppm, (a)(6)(ii) Ship Stations: 5ppm
47 CFR §2.1055	§ 2.1055 Measurements required: Frequency stability (a) The frequency stability shall be measured with variation of ambient temperature as follows: (1) From -30° to +50° centigrade for all equipment except that specified in paragraphs (a) (2) and (3) of this section. (d) The frequency stability shall be measured with variation of primary supply voltage as follows: (1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

Test Setup	Appendix A	Figure A.5
-------------------	-------------------	-------------------

Measurement Procedure

The DUT was connected to a Frequency Counter via a 30dB attenuator connected to the DUT's antenna port. The output power of the DUT was set to the manufacturer's highest rated in CW mode at 219.0625MHz. The temperature was allowed to stabilize and the frequency count was recorded at each temperature step. This procedure was carried out throughout the entire temperature range.

APPENDIX C – MEASUREMENT INSTRUMENT UNCERTAINTY

CISPR 16-4 Measurement Uncertainty (U_{LAB})

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence interval using a coverage factor of $k=2$

30MHz - 200MHz

$$U_{LAB} = 5.14\text{dB} \quad U_{CISPR} = 6.3\text{dB}$$

200MHz - 1000MHz

$$U_{LAB} = 5.90\text{dB} \quad U_{CISPR} = 6.3\text{dB}$$

1GHz - 6GHz

$$U_{LAB} = 4.80\text{dB} \quad U_{CISPR} = 5.2\text{dB}$$

6GHz - 18GHz

$$U_{LAB} = 5.1\text{dB} \quad U_{CISPR} = 5.5\text{dB}$$

If the calculated uncertainty U_{lab} is **less** than U_{CISPR} then:

- | | |
|---|---|
| 1 | Compliance is deemed to occur if NO measured disturbance exceeds the disturbance limit |
| 2 | Non-Compliance is deemed to occur if ANY measured disturbance EXCEEDS the disturbance limit |

If the calculated uncertainty U_{lab} is **greater** than U_{CISPR} then:

- | | |
|---|--|
| 3 | Compliance is deemed to occur if NO measured disturbance, increased by ($U_{lab} - U_{CISPR}$), exceeds the disturbance limit |
| 4 | Non-Compliance is deemed to occur if ANY measured disturbance, increased by ($U_{lab} - U_{CISPR}$), EXCEEDS the disturbance limit |
