1 Introduction and Conclusion

The tests indicated in section 2 were performed on the product constructed as described in section 3. The remaining test sections are the verbatim text from the actual data sheets used during the investigation. These test sections include the test name, the specified test method, a list of the actual test equipment used, documentation photos, results and raw data. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted.

Based on the results of our investigation, we have concluded the product tested complied with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested.

The INTERTEK-Lake Forest is located at 25791 Commercentre Dr, Lake Forest, CA. The radiated emission test site is a 3-meter semi-anechoic chamber. The chamber meets the characteristics of CISPR 16-1 and ANSI C63.4. For measurements, a remotely controlled flush-mount metal-top turntable is used to rotate the EUT a full 360 degrees. A remote controlled non-conductive antenna mast is used to scan the antenna height from one to four meters. The test site is listed with the FCC under registration number 381415. The test site is listed with Industry Canada under site number IC 2042T-1.

2 Test Summary

Page	Test full name	FCC Reference	IC Reference	Result
6	Output Power	§ 15.247(b)(3)	RSS-210 (A8.4)	Pass
11	Occupied Bandwidth	§ 15.247(a)(2)	RSS-210 A8.2(a)	Pass
	Power Spectral Density	§ 15.247(e)	RSS-210 (A8.2b)	Pass
19	Conducted Spurious Emissions	§ 15.247(d)	RSS-210 (A8.5)	Pass The EUT has a permanently attached internal antenna. No conducted measurements were taken. Only radiated measurements were performed.
20	Out-of-Band Radiated Emission (except emissions in Restricted Bands)	15.247(d) A8.5	15.247(d) A8.5	Pass
24	Radiated Spurious Emissions (Transmitter)	§ 15.247(d), § 15.209, and § 15.205	RSS-210 (2.2) (A8.5)	Pass
29	Radiated Emissions (Tx Mode)	§ 15.209	RSS-Gen (6.1)	Pass
32	AC Line Conducted Emissions	§ 15.107, § 15.207	RSS-Gen (7.2.4)	EUT is battery operated (exempt)
10	RF Exposure	15.247(i)	RS-102	Pass

3 Description of Equipment Under Test

Equipment Under Test	
Manufacturer	Salto Systems, S.L.
Model Number	AE9W
Serial Number	n/a
Family Series	AE9W
FCC Identifier	UKCAE9W
IC Identifier	10088A-AE9W
Receive Date	11/2/2013
Test Start Date	11/5/2013
Test End Date	11/23/2013
Device Received Condition	Good
Test Sample Type	Production sample
Frequency Band	2405MHz – 2480MHz
Mode(s) of Operation	Continuously transmitting a signal
Modulation Type	OQPSK
Number of Hopping Channels	No hopping
Transmission Control	Test Firmware
Test Channels	2405, 2445, 2480 MHz
Antenna Type (15.203)	Internal PCB Antenna w/ 1.7dBi gain
Power Supply	Powered by 3 AAA dry cells

Description of Equipment Under Test

ELECTRONIC PROXIMITY AELEMENT LOCK AE9W SERIES by SALTO SYSTEMS

Operating modes of the EUT:

No.	Descriptions of EUT Exercising
1	The EUT was setup in the software controlled test mode to continuously transmit a signal at the lowest (2405 MHz), middle (2445 MHz) and highest (2480 MHz) channels.
2	Transmitting its normal 13.56MHz signal for RFID
3	EUT was controlled by Salto System proprietary test software.

3.1 System setup including cable interconnection details, support equipment and simplified block diagram

4 Peak Conducted Power

4.1 Test Limits

§ 15.247(b)(3): For systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the *maximum conducted output power* is the highest total transmit power occurring in any mode.

§ 15.247(b)(4): The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

4.2 Test Procedure

ANSI C63.10: 2009 and KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems (47 CFR 15.247). The peak output power was measured using the channel power function of the spectrum analyzer.

4.3 Test Equipment Used:

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
Spectrum Analyzer	1140	Rohde & Schwarz	ESCI	2/10/2013	2/10/2014

4.4 Results:

The peak output power measurements were all below the 30dBm limit.

Mode	Channel Number	Frequency (MHz)	EIRP Radiated Peak Output Power (dBm)	Transmitter Antenna Gain (dB)	Conducted Peak Output Power (dBm)	Limit (dBm)	Result
OQPSK	Low	2405	-6.43	1.7	-4.73	30	Pass
OQPSK	Mid	2445	-8.72	1.7	-7.02	30	Pass
OQPSK	High	2480	-6.35	1.7	-4.65	30	Pass

EIRP Radiated Peak Output Power in dBm is calculated as E-field + 20 log(d) – 104.8

E-field = dBμV/m

(d) = distance at 3 meters

Conducted Peak Output Power is calculated as EIRP Radiated Peak Power minus the Antenna Gain of the transmitter.

Date: 11.NOV.2013 17:33:10

Peak Output Power, Low Channel

Frequency MHz	RA (dBμV)	AG (dB)	CF (dB)	ATT (dB1/m)	AF (dB1/m)	Final Field Strength (dBμV/m)	EIRP dBm	EIRP mW
2405	89.48	43.19	6.04	9.7	26.8	88.83	-6.47	0.23

RA = receiver amplitude

AG = amplifier gain

CF = cable factor

AF = cable factor

Final Field Strength is the same as E-Field

Final Field Strength = RA-AG+CF+AF

EIRP Radiated Peak Output Power in dBm is calculated as E-field + 20 log(d) – 104.8

E-field = dBμV/m

(d) = distance at 3 meters

 Final Field Strength is the same as E-Field

Final Field Strength = RA-AG+CF+AF

EIRP Radiated Peak Output Power in dBm is calculated as E-field + 20 log(d) – 104.8
 E-field = dBμV/m
 (d) = distance at 3 meters

4.5 RF Exposure Evaluations**MPE Evaluation**

The EUT is a wireless device used in a mobile application, at least 20 cm from anybody part of the user or nearby persons.

The maximum Peak EIRP calculated is -6.43 dBm, 0.23 mW; therefore, to comply with RF Exposure

Requirement, the MPE is calculated.

The Power Density can be calculated using the formula

$$S = \text{EIRP} / 4\pi D^2$$

Where: S is Power Density in W/m^2
D is the distance from the antenna.

It is considered that 20 cm is the minimum distance that a user can go closest to the EUT.

At 20 cm, $S = .0005 \text{ W/m}^2$, which is below the MPE Limit of 10 W/m^2

5 Occupied Bandwidth**5.1 Test Limits**

§ 15.247(a)(2): For digital modulation systems, the minimum 6dB bandwidth shall be at least 500kHz.

5.2 Test Procedure

ANSI C63.10: 2009 and KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems (47 CFR 15.247)

5.3 Test Equipment Used:

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
Spectrum Analyzer	1140	Rohde & Schwarz	ESCI	2/10/2013	2/10/2014

5.4 Results:

Mode	Channel Number	Frequency (MHz)	6dB Bandwidth	99% Power Bandwidth	Result
OQPSK	Low	2405	1.62MHz	2.98MHz	Pass
OQPSK	Mid	2445	1.62MHz	2.94MHz	Pass
OQPSK	High	2480	1.64MHz	2.90MHz	Pass

Date: 11.NOV.2013 16:54:58

6 Duty Cycle Correction Factor

Date: 13.NOV.2013 19:57:32

Date: 13.NOV.2013 19:59:34

100mS @ 10ms / div

Time on = 15.8 ms

Duty Cycle Calculation**Sample Calculation:**

If $T = 0.1$ second, calculate the Duty Cycle correction factor as $20\log(t/T)$.

If $T > 0.1$ second, calculate the Duty Cycle correction factor as $20\log(t/0.1)$

Result:

The duty cycle was calculated by measuring one pulse train in a 100 ms period. The pulse train consists of only "1 Short" 4.6 ms pulse.

Total ON time = 15.8 ms

Duty Cycle calculation: $20\log(15.8/100) = -16.02\text{dB}$

7 Conducted Spurious Emissions (This test was not performed)**7.1 Test Limits**

§ 15.247(d): In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

7.2 Test Procedure

ANSI C63.10: 2009 and KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems (47 CFR 15.247)

7.3 Test Equipment Used:

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
Spectrum Analyzer	1140	Rohde & Schwarz	ESCI	2/10/2013	2/10/2014

7.4 Results:

The device under test did not have a conducted antenna port, and therefore no conducted plots were taken.

8 Power Spectral Density

8.1 Test Limits

§ 15.247(e): For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

8.2 Test Procedure

ANSI C63.10: 2009 and KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems (47 CFR 15.247)

8.3 Test Equipment Used:

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
Spectrum Analyzer	1140	Rohde & Schwarz	ESCI	2/10/2013	2/10/2014

9 Radiated Spurious Emissions (Transmitter)

9.1 Test Limits

§ 15.247(d): In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Part 15.205(a): Restricted Bands of Operations

MHz	MHz	MHz	GHz
0.090–0.110	16.42–16.423	399.9–410	4.5–5.15

13.36–13.41			

¹ Until February 1, 1999, this restricted band shall be 0.490–0.510 MHz.

² Above 38.6

Part 15.209(a): Field Strength Limits for Restricted Bands of Operation

Frequency (MHz)	Field Strength (microvolts/meter)	Measurement Distance (meters)
0.009 - 0.490	2,400 / F (kHz)	300
0.490 - 1.705	24,000 / F (kHz)	30
1.705 - 30.0	30	30
30 - 88	100	3
88 - 216	150	3
216 - 960	200	3
Above 960	500	3

9.2 Test Procedure

ANSI C63.10: 2009 and KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems (47 CFR 15.247)

9.3 Example of Field Strength Calculation Method:

The measured field strength was calculated by summing the readings taken from the spectrum analyzer with the appropriate correction factors associated with the antenna losses and cable losses. The calculation formula and sample calculations are listed below:

Formula:

$$FS = RA - AG + AF + CF + DCF$$

FS = Field Strength in dB V/m

RA = Receiver Amplitude in dB V

AG = Amplifier Gain

AF = Antenna Factor in dB

CF = Cable Attenuation Factor in dB (Including preamplifier and filter attenuation)

DCF = Duty Cycle Correction Factor

Example Calculation:

$$RA = 19.48 \text{ dB V}$$

$$AF = 18.52 \text{ dB}$$

$$CF = 0.78 \text{ dB}$$

$$FS = 19.48 + 18.52 + 0.78 = 38.78 \text{ dB V/m}$$

$$\text{Level in V/m} = \text{Common Antilogarithm } [(38.78 \text{ dB V/m})/20] = 86.89 \text{ V/m}$$

9.4 Test Equipment Used:

9.5 Results:

All spurious emissions were attenuated by at least 20dB below the level of the fundamental as required by Part 15.247(d). Additionally, all emissions falling within restricted bands of operation and at the band edges were found to be below the limit specified in Part 15.209(a). The spurious emissions listed in the following tables are the worst case emissions. Emissions not reported were at or below the measurement noise floor. The test sample was evaluated on the x any y axis since it is a floor mounted device and is used in only one orientation.

Tx Channel	Spurious Frequency	Corrected Peak dBμV/m	Peak Limit	Peak Margin	Corrected Average dBμV/m	Avg Limit	Avg Margin	Results
Low channel 2405 MHz	4810	57.22	74	-16.78	41.13	54	-12.87	Compliant

10 Radiated Emissions (Tx Mode)**10.1 Test Limits**

§ 15.209: Except for Class A digital devices, the field strength of radiated emissions from unintentional radiators at a distance of 3 meters shall not exceed the following values:

Frequency of emission (MHz)	Field strength (microvolts/meter)	Field strength (dBuV/m)
30–88	100	40
88–216	150	43.5
216–960	200	46
Above 960	500	54

These limits are identical to those in RSS-GEN

10.2 Test Procedure

ANSI C63.4: 2009

10.3 Example of Field Strength Calculation Method:

The measured field strength was calculated by summing the readings taken from the spectrum analyzer with the appropriate correction factors associated with the antenna losses and cable losses. The calculation formula and sample calculations are listed below:

Formula:

$$FS = RA + AF + CF$$

FS = Field Strength in dB V/m

RA = Receiver Amplitude in dB V

AF = Antenna Factor in dB

CF = Cable Attenuation Factor in dB (Including preamplifier and filter attenuation)

Example Calculation:

RA = 19.48 dB V

AF = 18.52 dB

CF = 0.78 dB

$$FS = 19.48 + 18.52 + 0.78 = 38.78 \text{ dB V/m}$$

$$\text{Level in V/m} = \text{Common Antilogarithm } [(38.78 \text{ dB V/m})/20] = 86.89 \text{ V/m}$$

10.4 Test Equipment Used:

Description	ID Number	Manufacturer	Model	Cal. Date	Cal. Due
EMI Test Receiver	1140	Rohde & Schwarz	ESCI7	2/19/13	2/19/14
Spectrum Analyzer	960	Rohde & Schwarz	FSP	4/11/13	4/11/14

12 Conducted Emissions on AC Power Mains Mode (exempt due to battery powered)

12.1 Test Limits

§ 15.207(e): Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

*Decreases with the logarithm of the frequency.

12.2 Test Procedure

ANSI C63.4: 2003

12.3 Test Equipment Used:

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due

12.4 Results:

The sample tested is battery operated and therefore meets the requirement without testing due to the device having no connection to the AC Mains.

Conducted Emissions was not evaluated:

Date: Tested by: Standard: Test Point: Operation mode: Note:		Result: Exempt

Antenna Requirement per FCC Part 15.203

13.1 Test Limits

§ 15.203: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of §15.211, §15.213, §15.217, §15.219, or §15.221. Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with §15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.

13.2 Results:

The sample tested met the antenna requirement. The antenna utilized is an internal PCB antenna.

14 Measurement Uncertainty

The measured value related to the corresponding limit will be used to decide whether the equipment meets the requirements.

The measurement uncertainty figures were calculated and correspond to a coverage factor of $k = 2$, providing a confidence level of respectively 95.45 % in the case where the distributions characterizing the actual measurement uncertainties are normal (Gaussian).

Measurement uncertainty Table

Parameter	Uncertainty	Notes
Radiated emissions, 30 to 1000 MHz	+3.9dB	
Radiated emissions, 1 to 18 GHz	+4.2dB	
Radiated emissions, 18 to 40 GHz	+4.3dB	
Power Port Conducted emissions, 150kHz to 30 MHz	+2.8dB
