

Band	Select the desired mode. Default is “2.4GHz (B+G+N)”. It is strongly recommended that you set the Band to “2.4GHz (B+G+N)”, and all of 802.11b, 802.11g, and 802.11n wireless stations can connect to the WDAP-C7200AC. ■ 2.4 GHz (B): 802.11b mode, rate is up to 11Mbps ■ 2.4 GHz (G): 802.11g mode, rate is up to 54Mbps ■ 2.4 GHz (N): 802.11n mode, rate is up to 300Mbps(2T2R) ■ 2.4 GHz (B+G): 802.11b/g mode, rate is up to 11Mbps or 54Mbps ■ 2.4 GHz (G+N): 802.11g/n mode, rate is up to 54Mbps or 300Mbps ■ 2.4 GHz (B+G+N): 802.11b/g/n mode, rate is up to 11Mbps, 54Mbps, or 300Mbps
Mode	There are four kinds of wireless mode selections: ■ AP ■ Client ■ WDS ■ AP+WDS If you select WDS or AP+WDS, please click “WDS Settings” submenu for the related configuration. Furthermore, click the “Multiple AP” button to enable multiple SSID function.
SSID	The ID of the wireless network. User can access the wireless network via the ID only. However, if you switch to Client Mode, this field becomes the SSID of the AP you want to connect with. Default: Planet AP 2.4G
Channel Width	You can select 20MHz, or 40MHz.
Channel Number	You can select the operating frequency of wireless network. Default: 11
Broadcast SSID	If you enable “Broadcast SSID”, every wireless station located within the coverage of the AP can discover its signal easily. If you are building a public wireless network, enabling this feature is recommended. In private network, disabling “Broadcast SSID” can provide better wireless network security. Default is “Enabled”.
Data Rate	Set the wireless data transfer rate to a certain value. Since most of wireless devices will negotiate with each other and pick a proper data transfer rate automatically, it's not necessary to change this value unless you know what will happen after modification. Default is “Auto”.
Associated Clients	Click the “Show Active Clients” button to show the status table of active wireless clients.

Enable Universal Repeater Mode**(Acting as AP and client simultaneously)**

Universal Repeater is a technology used to extend wireless coverage. To enable Universal Repeater mode, check the box and enter the SSID you want to broadcast in the field below. Then please click "Security" submenu for the related settings of the AP you want to connect with.

■ Multiple-SSID

Enable multiple-SSID can broadcast multiple WLAN SSID's using virtual interfaces. You can have different encryption settings for each WLAN and you can restrict what they have access to.

Choose menu "**WLAN1 (2.4GHz)** → **Basic Settings** → **Multiple AP**" to configure the device as a general wireless access point with multiple SSIDs.

The screenshot shows the 'Wireless Basic Settings - WLAN2 (2.4GHz)' configuration page. It includes the following fields and options:

- ☐ Disable Wireless LAN Interface
- Band: 2.4 GHz (B+G+N) (dropdown menu)
- Mode: AP (dropdown menu) with a **MultipleAP** button highlighted by a red box.
- Network Type: Infrastructure (dropdown menu)
- SSID: Planet AP 2.4G (text input field)
- Add to Profile (button)

Figure 5-50 2.4GHz Wireless Basic Settings – Multiple AP

The device supports up to four multiple Service Set Identifiers. You can back to the **Basic Settings** page to set the Primary SSID. The SSID's factory default setting is **Planet 2.4G VAP1~4 (Multiple-SSID 1~4)**. The SSID can be easily changed to connect to an existing wireless network or to establish a new wireless network. When the information for the new SSID is finished, click the **Apply Changes** button to let your changes take effect.

Multiple APs Multiple APs - WLAN2 (2.4GHz)

This page shows and updates the wireless setting for multiple APs.

No.	Enable	Band	SSID	Data Rate	Broadcast SSID	WMM	Access	Tx Restrict (Mbps)	Rx Restrict (Mbps)	Active Client List	WLAN mode
AP1	☒	2.4 GHz (B+G+N)	Planet 2.4G VA	Auto	Enabled	Enabled	LAN	0	0	Show	AP
AP2	☒	2.4 GHz (B+G+N)	Planet 2.4G VA	Auto	Enabled	Enabled	LAN	0	0	Show	AP
AP3	☒	2.4 GHz (B+G+N)	Planet 2.4G VA	Auto	Enabled	Enabled	LAN	0	0	Show	AP
AP4	☒	2.4 GHz (B+G+N)	Planet 2.4G VA	Auto	Enabled	Enabled	LAN	0	0	Show	AP

Figure 5-51 2.4GHz Multiple-SSID

Once you have applied and saved those settings, you can then go to the “**WLAN1 (2.4GHz) → Security**” page on the AP to set up security settings for each of the SSIDs.

■ Universal Repeater

This mode allows the AP with its own BSS to relay data to a root AP to which it is associated with WDS disabled. The wireless repeater relays signal between its stations and the root AP for greater wireless range.

- Example of how to configure **Universal Repeater Mode**. Please take the following steps:
To configure each wireless parameter, please go to the “**WLAN2 (2.4GHz) → Basic Settings**” page.

Step 1. Configure wireless mode to “AP” and then check “**Enable Universal Repeater Mode (Acting as AP and client simultaneously)**”. Click “**Apply Changes**” to take effect.

Wireless Basic Settings - WLAN2 (2.4GHz)

This page is used to configure the parameters for wireless LAN clients which may connect to your Access Point. Here you may change wireless encryption settings as well as wireless network parameters.

☐ Disable Wireless LAN Interface

Figure 5-64 Wireless Advanced Settings – 2.4GHz

The page includes the following fields:

Object	Description
Fragment Threshold	You can specify the maximum size of packet during the fragmentation of data to be transmitted. If you set this value too low, it will result in bad performance. Default is "2346".
RTS Threshold	When the packet size is smaller than the RTS threshold, the access point will not use the RTS/CTS mechanism to send this packet. Default is "2347".
Beacon Interval	The interval of time that this access point broadcasts a beacon. Beacon is used to synchronize the wireless network. Default is "100".
IAPP	IAPP (Inter-Access Point Protocol) enabled is recommended as it describes an optional extension to IEEE 802.11 that provides wireless access-point communications among multivendor systems. Default is "Enabled".
Protection	It is recommended to enable the protection mechanism. This mechanism can decrease the rate of data collision between 802.11b and 802.11g wireless stations. When the protection mode is enabled, the throughput of the AP will be a little lower due to the transmission of heavy frame traffic. Default is "Disabled".
Aggregation	It is a function where the values of multiple rows are grouped together. Default is "Enabled"
Short GI	It is used to set the time that the receiver waits for RF reflections to settle out before sampling data. Default is "Enabled"
WLAN Partition	This feature also called " WLAN isolation " or " Block Relay ". If this is enabled, wireless clients cannot exchange data through the WDAP-C7200AC. Default is "Disabled".
STBC	Activate Space Time Blocking Code (STBC) which does not need channel state information (CSI). Default Setting: "Enabled"
LDPC	Low-density Parity-check Code is wireless data transmit algorithm. Default Setting: "Enabled"
20/40MHz Coexist	Configure 20/40MHz coexisting scheme. If you set up as "Enabled", "20MHz" and "40MHz" will coexist. Default Setting: "Disabled"

5.4.3 RF Output Power

Choose menu “**WLAN2 (2.4GHz) → RF Output Power**” to adjust to different levels of transmitting power for the wireless network according to various environment on this page. After the configuration, please click the “**Apply Changes**” button to save the settings.

Figure 5-65 RF Output Power – 2.4GHz

RF Output Power Control provides the flexibility to control the Wi-Fi Transmit power to optimize the wireless range. Wi-Fi power consumption for an Access Point could be reduced to up to 75% from its peak power consumption for serving small to medium size homes, while boosted to maximum power for large homes and businesses. The WDAP-C7200AC supports output power control levels up to 5. You can change the RF output power level here in accordance with various environments and signal strength.

5.4.4 Security

Choose menu “**WLAN2 (2.4GHz) → Security**” to configure the settings of wireless security for the wireless network on this page. After the configuration, please click the “Apply Changes” button to save the settings.

Wireless Security Setup - WLAN2 (2.4GHz)

This page allows you setup the wireless security. Turn on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your wireless network.

Figure 5-66 Wireless Security Settings – 2.4GHz

The page includes the following fields:

Object	Description
Select SSID	Select the SSID you want to configure the wireless security function, which includes the root one and the client one.
Encryption	Disable: No security setup for wireless connection. ■ WEP: It is based on the IEEE 802.11 standard. And the default setting of authentication is Automatic, which can select Open System or Shared Key authentication type automatically based on the wireless station's capability and request. Furthermore, you can select Key Length and enter 10 and 26 Hexadecimal digits (any combination of 0-9, a-f, A-F, zero key is not promoted) or 5 and 13 ASCII characters in the Encryption Key field. ■ WPA: WPA is a medium level encryption and is supported by most wireless devices and operating systems.

	■ WPA2: WPA2 is a high level encryption and is supported by most wireless devices and operating systems.
	■ WPA / WPA2 / WPA-Mixed: WPA Mixed Mode allows the use of both WPA and WPA2 at the same time.
Authentication Mode	■ Enterprise (RADIUS) When you select the authentication mode based on Enterprise (Radius Server), please enter the IP Address, Port, and Password of the Radius Server.
	■ Personal (Pre-Shared Key) When you select the other authentication mode based on Personal (Pre-Shared Key), please enter at least 8 ASCII characters (Passphrase) or 64 Hexadecimal characters. All of the Cipher Suites support TKIP and AES.
802.1x Authentication	Enable 802.1x authentication function and then enter the IP Address , Port , and Password of the Radius Server.

5.4.5 Access Control

Choose menu “**WLAN2 (2.4GHz) → Access Control**” to allow or deny the computer of specified MAC address to connect with the WDAP-C7200AC on this page. After the configuration, please click the “Apply Changes” button to save the settings.

Figure 5-67 Wireless Access Control – 2.4GHz

The page includes the following fields:

Object	Description
Wireless Access Control Mode	You can choose to set the Allowed-List, Denied-List, or disable this function.
MAC Address	Enter the MAC address you want to allow or deny connection to the WDAP-C7200AC in the field.
Comment	You can make some comment on each MAC address on the list.
Current Access Control List	You can select some MAC addresses and click the “Delete Selected” button to delete it.

■ Wireless Access Control example:

To deny a PC at the MAC address of 00:30:4F:00:00:01 to connect to your wireless network, do as follows:

Step 1. Select “Deny” from MAC Address Filter drop-down menu.

Step 2. Enter 00:30:4F:00:00:01 in the MAC address box and click “Add”.

Step 3. Click the “OK” button to save your settings and you can add more MAC addresses, if you like, simply repeat the above steps.

Wireless Access Control - WLAN2 (2.4GHz)

If you choose 'Allowed Listed', only those clients whose wireless MAC addresses are in the access control list will be able to connect to your Access Point. When 'Deny Listed' is selected, these wireless clients on the list will not be able to connect the Access Point.

5.4.6 WDS

WDS (Wireless Distribution System) feature can be used to extend your existing 2.4G or 5G wireless network coverage. Here we present you how to configure such feature in 2.4GHz, which also applies to 2.4GHz.

Before configuring the WDS Setting page, you have to select the wireless mode to **"WDS"** on the **WLAN2 (2.4GHz)** -> **Basic Settings** web page.

Wireless Basic Settings - WLAN2 (2.4GHz)

☐ Disable Wireless LAN Interface

Band: 2.4 GHz (B+G+N) ▼

Mode: WDS ▼ MultipleAP

Network Type: Infrastructure ▼

SSID: Planet AP 2.4G Add to Profile

Channel Width: 40MHz ▼

Figure 5-69 WDS Mode – 2.4GHz

Choose menu “**WLAN2 (2.4GHz) → WDS Settings**” to configure WDS to connect the WDAP-C7200AC with another AP on this page. After the configuration, please click the “**Apply Changes**” button to save the settings.

WDS Settings - WLAN2 (2.4GHz)

Wireless Distribution System uses wireless media to communicate with other APs, like the Ethernet does. To do this, you must set these APs in the same channel and set MAC address of other APs which you want to communicate with in the table and then enable the WDS.

☒ Enable WDS

Figure 5-71 WDS – Set Security

The page includes the following fields:

Object	Description
Enable WDS	Check the box to enable the WDS function. Please select WDS or AP+WDS in the Mode of Wireless Basic Settings before you enable WDS on this page.
MAC Address	You can enter the MAC address of the AP you want to connect with.
Data Rate	Default is “Auto”.
Comment	You can make some comment for each MAC address on the list.
Set Security	Click the “ Set Security ” button to configure the wireless security parameters of the AP you want to connect via WDS.
Show Statics	Click the “Show Statics” button to show the WDS AP.
Current WDS AP List	You can select some MAC addresses of the AP and click the “Delete Selected” button to delete it.

WDS feature can only be implemented between 2 wireless devices that both support the WDS feature. Plus, **channel**, **security settings** and **security key** must be **the same** on both such devices.

To encrypt your wireless network, click “**Set Security**”. For the detail of wireless security, see [section 5.5.4](#). Do remember to reboot the device after you save your wireless security settings; otherwise, the WDS feature may not function.

5.4.7 Site Survey

Choose menu “**WLAN2 (2.4GHz) → Site Survey**” to scan the available local AP. If any Access Point is found, you could choose any one to connect with manually when the **Client Mode** is enabled.

Wireless Site Survey - WLAN2 (2.4GHz)

This page provides tool to scan the wireless network. If any Access Point or IBSS is found, you could choose to connect it manually when client mode is enabled.

5.4.8 WPS

WPS (Wi-Fi Protected Setup) is designed to ease setup of security Wi-Fi networks and subsequently network management. This Wireless Router supports WPS features for **AP mode**, **AP+WDS mode**, **Infrastructure-Client mode**, and the wireless root interface of **Universal Repeater mode**.

Simply enter a PIN code or press the software PBC button or hardware WPS button (if any) and a secure wireless connection is established.

- **PBC**: If you find the WPS LED blinking for 2 minutes after you press the hardware WPS button on the device, it means that PBC encryption method is successfully enabled. And an authentication will be performed between your router and the WPS/PBC-enabled wireless client device during this time; if it succeeds, the wireless client device connects to your device, and the WPS LED turns off. Repeat steps mentioned above if you want to connect more wireless client devices to the device.
- **PIN**: To use this option, you must know the PIN code from the wireless client and enter it in corresponding field on your device while using the same PIN code on client side for such connection.

The page includes the following fields:

Object	Description
Disable WPS	You can check the box to disable the WPS function.
WPS Status	Here you can check if the connection via WPS is established or not.
Self-PIN Number	It is the PIN number of the WDAP-C7200AC here.
Push Button Configuration	Click the “Start PBC” to activate WPS as well in the client device within 2 minutes.
Client PIN Number	In addition to the PBC method, you can also use the PIN method to activate the WPS. Just enter the PIN number of the client device in the field and click the “Start PIN” button.

The WPS encryption can be implemented only between your Router and another WPS-capable device.

- Example of how to establish wireless connection using **WPS**. Please take the following steps:

Step 1. Choose menu “**WLAN2 (2.4GHz) → WPS**” to configure the setting for WPS. After the configuration, please click the “Apply Changes” button to save the settings.

Step 2. Add a new device.

If the wireless adapter supports Wi-Fi Protected Setup (WPS), you can establish a wireless connection between wireless adapter and AP using either Push Button Configuration (PBC) method or PIN method.

To build a successful connection by WPS, you should also do the corresponding configuration of the new device for WPS function.

A. By Push Button Configuration (PBC)

- i. Click the “Start PBC” Button on the WPS page of the AP.

WPS Status: ☐ Configured ☒ UnConfigured
 Reset to UnConfigured
 Auto-lock-down state: unlocked
 Self-PIN Number: 15051813
 Push Button Configuration:
 STOP WSC
 Client PIN Number:

Figure 5-73 WPS-PBC – 2.4GHz-1

Figure 5-74 WPS-PBC – 2.4GHz-2

- ii. Press and hold the WPS Button equipped on the adapter directly for 2 or 3 seconds. Or you can click the WPS button with the same function in the configuration utility of the adapter. The process must be finished within 2 minutes.
- iii. Wait for a while until the next screen appears. Click **OK** to complete the WPS configuration.

B. By PIN

If the new device supports Wi-Fi Protected Setup and the PIN method, you can add it to the network by PIN with the following two methods.

Method One: Enter the PIN of your Wireless adapter into the configuration utility of the AP

- i. Enter the PIN code of the wireless adapter in the field behind **Client PIN Number** in the following figure and then click **Start PIN**.

The PIN code of the adapter is always displayed on the WPS configuration screen.

WPS Status: ☐ Configured ☒ UnConfigured
 Reset to UnConfigured

Auto-lock-down state: unlocked

Self-PIN Number: 15051813

Push Button Configuration:

STOP WSC

Client PIN Number:

Figure 5-75 WPS-PIN – 2.4GHz-1

Applied WPS PIN successfully!

You have to run Wi-Fi Protected Setup within 2 minutes.

Figure 5-76 WPS-PIN – 2.4GHz-2

- ii. For the configuration of the wireless adapter, please choose the option that you want to **enter PIN into the AP (Enrollee)** in the configuration utility of the WPS and click **Next** until the process finishes.

Method Two: Enter the PIN of the AP into the configuration utility of your Wireless adapter

- i. Click the “Start PBC” Button on the WPS page of the AP. Get the Current PIN code of the AP in [WPS page](#) (each AP has its unique PIN code).

WPS Status: ☐ Configured ☒ UnConfigured
 Reset to UnConfigured

Auto-lock-down state: unlocked

Self-PIN Number: 15051813 Enter this PIN into the wireless adapter's configuration page.

Push Button Configuration:

STOP WSC

Client PIN Number:

Figure 5-77 WPS-PIN – 2.4GHz-3

- ii. For the configuration of the wireless adapter, please choose the option that you want to **enter the PIN of the AP (Registrar)** in the configuration utility of the Wireless adapter and enter it into the field. Then click **Next** until the process finishes.

5.4.9 Schedule

Wireless Schedules will enable or disable your wireless access at a set time based on your predefined schedule. This feature is often used for restricting access to all users (such as children, employees and guests) during specific times of the day for parental control or security reasons.

Choose menu “**WLAN2 (2.4GHz) → Schedule**” to configure the schedule rule of enabling wireless function. After the configuration, please click the “Apply Changes” button to save the settings.

Wireless Schedule - WLAN2 (2.4GHz)

This page allows you setup the wireless schedule rule. Please do not forget to configure system time before enable this feature.

☒ **Enable Wireless Schedule**

Figure 5-80 Status

5.5.2 Statistics

Choose menu “**Management** → **Statistics**” to show the packet counters for transmission and reception regarding wireless and Ethernet network.

Figure 5-81 Statistics

The page includes the following fields:

Object	Description
Wireless LAN <i>Sent Packets</i>	It shows the statistic count of sent packets on the wireless LAN interface.
Wireless LAN <i>Received Packets</i>	It shows the statistic count of received packets on the wireless LAN interface.
Ethernet WAN <i>Sent Packets</i>	It shows the statistic count of sent packets on the Ethernet WAN interface.
Ethernet WAN <i>Received Packets</i>	It shows the statistic count of received packets on the Ethernet WAN interface.
Refresh	Click the refresh the statistic counters on the screen.

5.5.3 NTP Settings

This section assists you in setting the Wireless AP's system time. You can either select to set the time and date manually or automatically obtain the GMT time from Internet.

Choose menu **"Management → NTP Settings"** to configure the system time. You can also maintain the system time by synchronizing with a public time server over the Internet. After the configuration, please click the **"OK"** button to save the settings.

The configured time and date settings are lost when the Wireless AP is powered off.

Time Zone Setting

You can maintain the system time by synchronizing with a public time server over the Internet.

Current Time : / / (YYYY/MM/DD)
 : : (hh:mm:ss)

Time Zone Select :

☐ Automatically Adjust Daylight Saving

☐ Enable NTP client update

NTP server : ☐
☐ (Manual IP Setting)

Figure 5-82 Time Zone Settings

The page includes the following fields:

Object	Description
Current Time	Input current time manually. You can click " Copy Computer Time " button to copy the PC's current time to the AP.
Time Zone Select	Select the time zone of the country you are currently in. The router will set its time based on your selection.
Automatically Adjust Daylight Saving	Select the time offset, if your location observes daylight saving time.
Enable NTP client update	Check to enable NTP update. Once this function is enabled, AP will automatically update current time from NTP server.
NTP Server	User may select prefer NTP sever or input address of NTP server manually.

If the AP loses power for any reason, it cannot keep its clock running, and will not have the correct time when it is started again. To maintain correct time for schedules and logs, either you must enter the correct time after you restart the AP, or you must enable the NTP Server option.

5.5.4 Schedule Reboot

This page allows you to enable and configure system reboot schedule. The device can regularly reboot according to the reserved time when connecting to the Internet.

Schedule Reboot

This page allows you to enable and configure system reboot schedule. The device can regularly reboot according to the reserved time when connecting to the Internet.

Schedule Reboot Setting: ☐ Enable ☒ Disable

Reboot Time: (Hour: Minute, ex: 02:23, or 13:14)

Reboot Plan:

Weekday: ☒ SUN. ☒ MON. ☒ TUE. ☒ WED. ☒ THUR. ☒ FRI. ☒ SAT.

Figure 5-83 Schedule Reboot

The page includes the following fields:

Object	Description
Schedule Reboot Setting	Enable or disable the Schedule Reboot function.
Reboot Time	Enter the Reboot Time (24-hour format) to enable this function to take effect.
Reboot Plan	There are two Reboot Plans supported in the AP: Weekday: select this option to let the device reboot automatically according to the reserved time in one or more days of a week. Every day: select this option to let the device reboot automatically according to the reserved time every day.

Weekday	Check one or more days to let the device auto reboot on schedule. When choosing “Every day” as your reboot plan, the “Weekday” will be grayed out (disabled), which means Every day will auto reboot at the time that you scheduled.
----------------	--

1. This setting will only take effect when the Internet connection is accessible and the GMT time is configured correctly.
2. You must select at least one day when choosing “**Weekday**” as your reboot plan.
3. When choosing “**Every day**” as your reboot plan, the “**Weekday**” will be grayed out (disabled), which means **Every day** will auto reboot at the time that you schedule.

■ Example of how to configure **Schedule Reboot**. Please take the following steps:

Before configured schedule reboots, please ensure the Internet connection is accessible and the GMT time is configured correctly according to **NTP Settings** page.

Step 1. Select the Schedule Reboot Setting checkbox.

Step 2. Enter the Reboot Time (24-hour format) to enable this function to take effect. For example, if you want this function to work at 23:00 every Sunday, choose "Weekday" in the Reboot Plan field.

Schedule Reboot

This page allows you to enable and configure system reboot schedule. The device can regularly reboot according to the reserved time when connecting to the Internet.

5.5.6 Upgrade Firmware

This page allows you upgrade the Access Point firmware to new version. Please note, do not power off the device during the upload because it may crash the system.

Choose menu “**Management → Upgrade Firmware**” to upgrade the firmware of the WDAP-C7200AC. Select the new firmware file downloaded from the PLANET website and then click “**Upload**” button to upgrade it.

Figure 5-86 Upgrade Firmware

The page includes the following fields:

Object	Description
Select File	Browse and select file you want to upgrade and press Upload to perform upgrade. Please wait till the related information is shown on the screen after upgrade is finished.

Do not disconnect the Wireless AP from your management PC (the PC you use to configure the device) or power off it during the upgrade process; otherwise, it may be permanently damaged. The Wireless AP will restart automatically when the upgrade process, which takes several minutes, to complete.

5.5.7 Reload Settings

Choose menu “**Management → Reload Settings**” to back up or reset the configuration of the WDAP-C7200AC.

Once you have configured the Wireless AP the way you want it, you can save these settings to a configuration file on your local hard drive that can later be imported to your Wireless AP in case the device is restored to factory default settings.

Save/Reload Settings

This page allows you save current settings to a file or reload the settings from the file which was saved previously. Besides, you could reset the current configuration to factory default.

Save Settings to File:

Load Settings from File:

Reset Settings to Default:

Figure 5-87 Save/Reload Settings

Chapter 6. Quick Connection to a Wireless Network

In the following sections, the **default SSID** of the WDAP-C7200AC is configured to “**default**”.

6.1 Windows XP (Wireless Zero Configuration)

Step 1: Right-click on the **wireless network icon** displayed in the system tray

Figure 6-1 System Tray – Wireless Network Icon

Step 2: Select [View Available Wireless Networks]

Step 3: Highlight and select the wireless network (SSID) to connect

- (1) Select SSID [default]
- (2) Click the [Connect] button

Figure 6-2 Choose a wireless network

Step 4: Enter the **encryption key** of the Wireless AP

- (1) The Wireless Network Connection box will appear
- (2) Enter the encryption key that is configured in [section 5.3.3](#)
- (3) Click the [Connect] button

**Figure 6-3** Enter the network key**Step 5:** Check if “Connected” is displayed**Figure 6-4** Choose a wireless network -- Connected

Some laptops are equipped with a “Wireless ON/OFF” switch for the internal wireless LAN. Make sure the hardware wireless switch is switched to “ON” position.

6.2 Windows 7 (WLAN AutoConfig)

WLAN AutoConfig service is built-in in Windows 7 that can be used to detect and connect to wireless network. This built-in wireless network connection tool is similar to wireless zero configuration tool in Windows XP.

Step 1: Right-click on the **network icon** displayed in the system tray

Figure 6-5 Network icon

Step 2: Highlight and select the wireless network (SSID) to connect

- (1) Select SSID [**default**]
- (2) Click the [**Connect**] button

Figure 6-6 WLAN AutoConfig

If you will be connecting to this Wireless AP in the future, check [**Connect automatically**].

Step 4: Enter the **encryption key** of the Wireless AP

- (1) The Connect to a Network box will appear
- (2) Enter the encryption key that is configured in [section 5.3.3](#)
- (3) Click the [OK] button

Figure 6-7 Type the network key

Figure 6-8 Connecting to a Network

Step 5: Check if “**Connected**” is displayed

Figure 6-9 Connected to a Network

6.3 Mac OS X 10.x

In the following sections, the default SSID of the WDAP-C7200AC is configured to “default”.

Step 1: Right-click on the **network icon** displayed in the system tray

The AirPort Network Connection menu will appear

Figure 6-10 Mac OS – Network icon

Step 2: Highlight and select the wireless network (SSID) to connect

- (1) Select and SSID [**default**]
- (2) Double-click on the selected SSID

Figure 6-11 Highlight and select the wireless network

Step 4: Enter the **encryption key** of the Wireless AP

- (1) Enter the encryption key that is configured in [section 5.3.3](#)
- (2) Click the [OK] button

Figure 6-12 Enter the Password

If you will be connecting to this Wireless AP in the future, check [**Remember this network**].

Step 5: Check if the AirPort is connected to the selected wireless network.

If “Yes”, then there will be a “check” symbol in the front of the SSID.

Figure 6-13 Connected to the Network

There is another way to configure the MAC OS X Wireless settings:

Step 1: Click and open the [System Preferences] by going to **Apple > System Preference** or **Applications**

Figure 6-14 System Preferences

Step 2: Open **Network Preference** by clicking on the [Network] icon

Figure 6-15 System Preferences -- Network

Step 3: Check Wi-Fi setting and select the available wireless network

- (1) Choose the **AirPort** on the left-menu (make sure it is ON)
- (2) Select Network Name **[default]** here

If this is the first time to connect to the Wireless AP, it should show “Not network selected”.

Figure 6-16 Select the Wireless Network

6.4 iPhone / iPod Touch / iPad

In the following sections, the **default SSID** of the WDAP-C7200AC is configured to “**default**”.

Step 1: Tap the [Settings] icon displayed in the home screen

Figure 6-17 iPhone – Settings icon

Step 2: Check Wi-Fi setting and select the available wireless network

(3) Tap [General] \ [Network]

(4) Tap [Wi-Fi]

If this is the first time to connect to the Wireless AP, it should show “Not Connected”.

Figure 6-18 Wi-Fi Setting

Figure 6-19 Wi-Fi Setting – Not Connected

Step 3: Tap the target wireless network (SSID) in “Choose a Network...”

- (1) Turn on Wi-Fi by tapping “Wi-Fi”
- (2) Select SSID [default]

Figure 6-20 Turn on Wi-Fi

Step 4: Enter the **encryption key** of the Wireless AP

- (1) The password input screen will be displayed
- (2) Enter the encryption key that is configured in [section 5.3.3](#)
- (3) Tap the [Join] button

Figure 6-21 iPhone -- Enter the Password

Step 5: Check if the device is connected to the selected wireless network.

If “Yes”, then there will be a “check” symbol in the front of the SSID.

Appendix A: Planet Smart Discovery Utility

To easily list the WDAP-C7200AC in your Ethernet environment, the Planet Smart Discovery Utility from user's manual CD-ROM is an ideal solution.

The following installation instructions guide you to running the Planet Smart Discovery Utility.

Step 1: Deposit the **Planet Smart Discovery Utility** in administrator PC.

Step 2: Run this utility and the following screen appears.

Step 3: Press “**Refresh**” button for the current connected devices in the discovery list as shown in the following screen:

Step 3: Press “**Connect to Device**” button and then the Web login screen appears.

The fields in white background can be modified directly and then you can apply the new setting by clicking the “**Update Device**” button.

Appendix B: Troubleshooting

If you find the AP is working improperly or stop responding to you, please read this troubleshooting first before contacting the dealer for help. Some problems can be solved by yourself within a very short time.

Scenario	Solution
The AP is not responding to me when I want to access it by Web browser.	- Please check the connection of the power cord and the Ethernet cable of this AP. All cords and cables should be correctly and firmly inserted to the AP. - If all LED on this AP is off, please check the status of power adapter, and make sure it is correctly powered. - You must use the same IP address section which AP uses. - Are you using MAC or IP address filter? Try to connect the AP by another computer and see if it works; if not, please reset the AP to the factory default settings (pressing 'reset' button for over 7 seconds). - Use the Smart Discovery Tool to see if you can find the AP or not. - If you did a firmware upgrade and this happens, contact your dealer of purchase for help. - If all the solutions above don't work, contact the dealer for help.
I can't get connected to the Internet.	- Go to 'Status' -> 'Internet Connection' menu on the router connected to the AP, and check Internet connection status. - Please be patient, sometimes Internet is just that slow. - If you've connected a computer to Internet directly before, try to do that again, and check if you can get connected to Internet with your computer directly attached to the device provided by your Internet service provider. - Check PPPoE / L2TP / PPTP user ID and password entered in the router's settings again. - Call your Internet service provider and check if there's something wrong with their service. - If you just can't connect to one or more website, but you can still use other internet services, please check URL/Keyword filter. - Try to reset the AP and try again later. - Reset the device provided by your Internet service provider too.

	i. Try to use IP address instead of host name. If you can use IP address to communicate with a remote server, but can't use host name, please check DNS setting.
I can't locate my AP by my wireless device.	a. 'Broadcast ESSID' set to off? b. Both two antennas are properly secured. c. Are you too far from your AP? Try to get closer. d. Please remember that you have to input ESSID on your wireless client manually, if ESSID broadcast is disabled.
File downloading is very slow or breaks frequently.	a. Are you using QoS function? Try to disable it and try again. b. Internet is slow sometimes. Please be patient. c. Try to reset the AP and see if it's better after that. d. Try to know what computers do on your local network. If someone's transferring big files, other people will think Internet is really slow. e. If this never happens before, call you Internet service provider to know if there is something wrong with their network.
I can't log into the web management interface; the password is wrong.	a. Make sure you're connecting to the correct IP address of the AP! b. Password is case-sensitive. Make sure the 'Caps Lock' light is not illuminated. c. If you really forget the password, do a hard reset.
The AP becomes hot	a. This is not a malfunction, if you can keep your hand on the AP's case. b. If you smell something wrong or see the smoke coming out from AP or A/C power adapter, please disconnect the AP and power source from utility power (make sure it's safe before you're doing this!), and call your dealer of purchase for help.

Appendix C: Glossary

- **802.11ac** - 802.11ac is a wireless networking standard in the 802.11 family (which is marketed under the brand name Wi-Fi), developed in the IEEE Standards Association process, providing high-throughput wireless local area networks (WLANs) on the 5 GHz band.
- **802.11n** - 802.11n builds upon previous 802.11 standards by adding MIMO (multiple-input multiple-output). MIMO uses multiple transmitter and receiver antennas to allow for increased data throughput via spatial multiplexing and increased range by exploiting the spatial diversity, perhaps through coding schemes like Alamouti coding. The Enhanced Wireless Consortium (EWC) [3] was formed to help accelerate the IEEE 802.11n development process and promote a technology specification for interoperability of next-generation wireless local area networking (WLAN) products.
- **802.11a** - 802.11a was an amendment to the IEEE 802.11 wireless local network specifications that defined requirements for an orthogonal frequency division multiplexing (OFDM) communication system. It was originally designed to support wireless communication in the unlicensed national information infrastructure (U-NII) bands (in the 5–6 GHz frequency range) as regulated in the United States by the Code of Federal Regulations, Title 47, Section 15.407.
- **802.11b** - The 802.11b standard specifies a wireless networking at 11 Mbps using direct-sequence spread-spectrum (DSSS) technology and operating in the unlicensed radio spectrum at 2.4GHz, and WEP encryption for security. 802.11b networks are also referred to as Wi-Fi networks.
- **802.11g** - specification for wireless networking at 54 Mbps using direct-sequence spread-spectrum (DSSS) technology, using OFDM modulation and operating in the unlicensed radio spectrum at 2.4GHz, and backward compatibility with IEEE 802.11b devices, and WEP encryption for security.
- **DDNS (Dynamic Domain Name System)** - The capability of assigning a fixed host and domain name to a dynamic Internet IP Address.
- **DHCP (Dynamic Host Configuration Protocol)** - A protocol that automatically configure the TCP/IP parameters for the all the PC(s) that are connected to a DHCP server.
- **DMZ (Demilitarized Zone)** - A Demilitarized Zone allows one local host to be exposed to the Internet for a special-purpose service such as Internet gaming or videoconferencing.
- **DNS (Domain Name System)** - An Internet Service that translates the names of websites into IP addresses.
- **Domain Name** - A descriptive name for an address or group of addresses on the Internet.
- **DSL (Digital Subscriber Line)** - A technology that allows data to be sent or received over existing traditional phone lines.
- **ISP (Internet Service Provider)** - A company that provides access to the Internet.

- **MTU (Maximum Transmission Unit)** - The size in bytes of the largest packet that can be transmitted.
- **NAT (Network Address Translation)** - NAT technology translates IP addresses of a local area network to a different IP address for the Internet.
- **PPPoE (Point to Point Protocol over Ethernet)** - PPPoE is a protocol for connecting remote hosts to the Internet over an always-on connection by simulating a dial-up connection.
- **SSID - A Service Set Identification** is a thirty-two character (maximum) alphanumeric key identifying a wireless local area network. For the wireless devices in a network to communicate with each other, all devices must be configured with the same SSID. This is typically the configuration parameter for a wireless PC card. It corresponds to the ESSID in the wireless Access Point and to the wireless network name.
- **WEP (Wired Equivalent Privacy)** - A data privacy mechanism based on a 64-bit or 128-bit or 152-bit shared key algorithm, as described in the IEEE 802.11 standard.
- **Wi-Fi** - A trade name for the 802.11b wireless networking standard, given by the Wireless Ethernet Compatibility Alliance (WECA, see <http://www.wi-fi.net>), an industry standards group promoting interoperability among 802.11b devices.
- **WLAN (Wireless Local Area Network)** - A group of computers and associated devices communicate with each other wirelessly, which network serving users are limited in a local area.

EC Declaration of Conformity

English	Hereby, PLANET Technology Corporation , declares that this 11ac Wireless AP is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.	Lietuviškai	Šiuo PLANET Technology Corporation , skelbia, kad 11ac Wireless AP tenkina visus svarbiausius 1999/5/EC direktyvos reikalavimus ir kitas svarbias nuostatas.
Česky	Společnost PLANET Technology Corporation , tímto prohlašuje, že tato 11ac Wireless AP splňuje základní požadavky a další příslušná ustanovení směrnice 1999/5/EC.	Magyar	A gyártó PLANET Technology Corporation , kijelenti, hogy ez a 11ac Wireless AP megfelel az 1999/5/EK irányelv alapkövetelményeinek és a kapcsolódó rendelkezéseknek.
Dansk	PLANET Technology Corporation , erklærer herved, at følgende udstyr 11ac Wireless AP overholder de væsentlige krav og øvrige relevante krav i direktiv 1999/5/EF	Malti	Hawnhekk, PLANET Technology Corporation , jiddikjara li dan 11ac Wireless AP jikkonforma mal-ħtiġijiet essenzjali u ma provvedimenti oħrajn rilevanti li hemm fid-Dirrettiva 1999/5/EC
Deutsch	Hiermit erklärt PLANET Technology Corporation , dass sich dieses Gerät 11ac Wireless AP in Übereinstimmung mit den grundlegenden Anforderungen und den anderen relevanten Vorschriften der Richtlinie 1999/5/EG befindet". (BMW)	Nederlands	Hierbij verklaart, PLANET Technology Corporation , dat 11ac Wireless AP in overeenstemming is met de essentiële eisen en de andere relevante bepalingen van richtlijn 1999/5/EG
Eestikeeles	Käesolevaga kinnitab PLANET Technology Corporation , et see 11ac Wireless AP vastab Euroopa Nõukogu direktiivi 1999/5/EC põhinõuetele ja muudele olulistele tingimustele.	Polski	Niniejszym firma PLANET Technology Corporation , oświadcza, że 11ac Wireless AP spełnia wszystkie istotne wymogi i klauzule zawarte w dokumencie „Directive 1999/5/EC”.
Ελληνικά	ΜΕ ΤΗΝ ΠΑΡΟΥΣΑ, PLANET Technology Corporation , ΔΗΛΩΝΕΙ ΟΤΙ ΑΥΤΟ 11ac Wireless AP ΣΥΜΜΟΡΦΩΝΕΤΑΙ ΠΡΟΣ ΤΙΣ ΟΥΣΙΩΔΕΙΣ ΑΠΑΙΤΗΣΕΙΣ ΚΑΙ ΤΙΣ ΛΟΙΠΕΣ ΣΧΕΤΙΚΕΣ ΔΙΑΤΑΞΕΙΣ ΤΗΣ ΟΔΗΓΙΑΣ 1999/5/ΕΚ	Português	PLANET Technology Corporation , declara que este 11ac Wireless AP está conforme com os requisitos essenciais e outras disposições da Directiva 1999/5/CE.
Español	Por medio de la presente, PLANET Technology Corporation , declara que 11ac Wireless AP cumple con los requisitos esenciales y cualesquiera otras disposiciones aplicables o exigibles de la Directiva 1999/5/CE	Slovensky	Výrobca PLANET Technology Corporation , týmto deklaruje, že táto 11ac Wireless AP je v súlade so základnými požiadavkami a ďalšími relevantnými predpismi smernice 1999/5/EC.
Français	Par la présente, PLANET Technology Corporation , déclare que les appareils du 11ac Wireless AP sont conformes aux exigences essentielles et aux autres dispositions pertinentes de la directive 1999/5/CE	Slovensko	PLANET Technology Corporation , s tem potrjuje, da je ta 11ac Wireless AP skladen/a z osnovnimi zahtevami in ustreznimi določili Direktive 1999/5/EC.
Italiano	Con la presente, PLANET Technology Corporation , dichiara che questo 11ac Wireless AP è conforme ai requisiti essenziali ed alle altre disposizioni pertinenti stabilite dalla direttiva 1999/5/CE.	Suomi	PLANET Technology Corporation , vakuuttaa täten että 11ac Wireless AP tyyppinen laite on direktiivin 1999/5/EY oleellisten vaatimusten ja sitä koskevien direktiivin muiden ehtojen mukainen.
Latviski	Ar šo PLANET Technology Corporation , apliecina, ka šī 11ac Wireless AP atbilst Direktīvas 1999/5/EK pamatprasībām un citiem atbilstošiem noteikumiem.	Svenska	Härmed intygar, PLANET Technology Corporation , att denna 11ac Wireless AP står i överensstämmelse med de väsentliga egenskapskrav och övriga relevanta bestämmelser som framgår av direktiv 1999/5/EG.
