AMGOO
ideas made mobile!

Any Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Specific Absorption Rate (SAR) information
SAR tests are conducted using standard operating positions accepted by the FCC with the phone transmitting at its highest certified power level in all tested frequency bands, although the SAR is determined at the highest certified power level, the actual SAR level of the phone while operating can be well below the maximum value, in general, the closer you are to a wireless base station antenna, the lower the power output. Before a new model phone is available for sale to the public, it must be tested and certified to the FCC that it does not exceed the exposure limit established by the FCC. Tests for each phone are performed in positions and locations (e.g. at the ear and worn on the body) as required by the FCC. For body worn operation, this model phone has been tested and meets the FCC RF exposure guidelines when used with an accessory designated for this product or when used with an accessory that Contains no metal and that positions the handset a minimum of 1.0 cm from the body. Non-compliance with the above restrictions may result in violation of RF exposure guidelines.

A diagram of a black smartphone with various components labeled with red text and lines. The labels include: Front camera (top left), USB (top center), Headphone (top right), Receiver (top right, below Headphone), Up (left side, above Down), Down (left side, below Up), Power (right side), Display screen (center, pointing to the screen), Call (bottom left, pointing to the call icon), MIC (bottom left, pointing to the microphone hole), Menu Key (bottom center, pointing to the left capacitive key), Home Key (bottom center, pointing to the central capacitive key), and Back Key (bottom right, pointing to the right capacitive key). The screen displays the AMGOO logo and a blue abstract background.
