

TEST REPORT

Applicant:	Janam Technologies LLC
Address of Applicant:	100 CROSSWAYS PARK WEST, SUITE 105, WOODBURY, New York, United States 11797
Manufacturer:	Janam Technologies LLC
Address of Manufacturer:	100 CROSSWAYS PARK WEST, SUITE 105, WOODBURY, New York, United States 11797
Product name:	XM20 MOBILE BARCODE TERMINAL
Model:	XM20
Rating(s):	Rechargeable battery: 3.7Vdc DC 5.5V, 2A
Trademark:	XM
Standards:	FCC Part 15.247 :2013
FCC ID:	UTWXM20-R
Date of Receipt:	2014-12-01
Date of Test:	2014-12-01~2015-05-18
Date of Issue:	2015-05-18
Test Result	Pass*

* In the configuration tested, the test item complied with the standards specified above.

Possible test case verdicts:

test case does not apply to the test object ...: N/A

test object does meet the requirement: P (Pass)

test object does not meet the requirement ...: F (Fail)

Testing Laboratory information:

Testing Laboratory Name: I-Test Laboratory

Address.....: 1-2 floor, South Block, Building A2 , No 3 Keyan Lu,
Science City, Guangzhou, Guangdong Province, P.R. China

Testing location : Same as above

Tel : 0086-20-32209330

Fax : 0086-20-62824387

E-mail : itl@i-testlab.com

General remarks:

The test results presented in this report relate only to the object tested.

The results contained in this report reflect the results for this particular model and serial number. It is the responsibility of the manufacturer to ensure that all production models meet the intent of the requirements detailed within this report.

This report would be invalid test report without all the signatures of testing technician and approver.

This report shall not be reproduced, except in full, without the written approval of the Issuing testing laboratory.

General product information:

There are two config - 18000C config and Railway Config.

For 18000C config

Operating Frequency: 902.75 MHz to 927.25 MHz for RFID

Channels: 50 channels with 0.5MHz step for RFID

Modulation Technique: ASK

For Railway config

Operating Frequency: 918.7 MHz to 921.45 MHz for RFID

Channels: 51 channels with 25KHz step for RFID

Modulation Technique: Carrier only

1 Test Summary

Test	Test Requirement	Test method	Result
Antenna Requirement	FCC PART 15 C section 15.247 (c) and Section 15.203	FCC PART 15 C section 15.247 (c) and Section 15.203	PASS
Occupied Bandwidth (-20dB)	FCC PART 15 C section 15.247 (a)(1)(i);	ANSI C63.10: 2009 Clause 6.9 & DA 00-705	PASS
Carrier Frequencies Separated	FCC PART 15 C section 15.247(a)(1);	DA 00-705	PASS
Hopping Channel Number	FCC PART 15 C section 15.247(a)(1)(i)	DA 00-705	PASS
Dwell Time	FCC PART 15 C section 15.247(a)(1)(i);	DA 00-705	PASS
Maximum Peak Output Power	FCC PART 15 C section 15.247(b)(2);	ANSI C63.10:2009 Clause 6.10 & DA 00-705	PASS
Conducted Spurious Emission (30 MHz to 25 GHz)	FCC PART 15 C section 15.247(d);	ANSI C63.10:2009 Clause 6.7 & DA 00-705	PASS
Radiated Spurious Emission (9 kHz to 25 GHz)	FCC PART 15 C section 15.247(d);	ANSI C63.10:2009 Clause 6.4, 6.5 and 6.6 & DA 00-705	PASS
Band Edges Measurement	FCC PART 15 C section 15.247 (d) &15.205	ANSI C63.10:2009 Clause 6.9 & DA 00-705	PASS
Conducted Emissions at Mains Terminals	FCC PART 15 C section 15.207;	ANSI C63.10:2009 Clause 6.2 & DA 00-705	PASS

3 General Information

3.1 Client Information

Applicant: Janam Technologies LLC
Address of Applicant: 100 CROSSWAYS PARK WEST, SUITE 105, WOODBURY, New York,
United States 11797

3.2 General Description of E.U.T.

Name: XM20 MOBILE BARCODE TERMINAL
Model No.: XM20
Trade Mark: XM
Operating Frequency: 902.75 MHz to 927.25 MHz for RFID (For 18000C config)
918.7 MHz to 921.45 MHz for RFID (For Railway config)
Channels: 50 channels with 0.5MHz step for RFID (For 18000C config)
51 channels with 25KHz step for RFID (For Railway config)
Modulation Technique: ASK (For 18000C config)
Carrier only (For Railway config)
Dwell time: Per channel is less than 0.4s.
Antenna Type: Patch Antenna
Antenna gain: 2.2dBi max
Function: RFID Reader

3.3 Details of E.U.T.

EUT Power Supply: Lithium battery :3.7V×1
Test mode: The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.
Power cord: /

3.4 Description of Support Units

The EUT has been tested as an independent unit for fixed frequency by testing lab.

3.5 Test Location

All tests were performed at:

I-Test Laboratory

1-2 floor, South Block, Building A2 , No 3 Keyan Lu, Science City, Guangzhou, Guangdong Province, P.R. China

0086-20-32209330

itl@i-testlab.com

No tests were sub-contracted.

3.6 Deviation from Standards

Biconical and log periodic antennas were used instead of dipole antennas.

3.7 Abnormalities from Standard Conditions

None.

3.8 Other Information Requested by the Customer

None.

3.9 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

- CNAS(Lab code:L4957)
- FCC (Registration No.:935596)
- IC (Registration NO.:8368A)

3.10 Measurement Uncertainty

The below measurement uncertainties given below are based on a 95% confidence level (base on a coverage factor (k=2).)

Parameter	Uncertainty
Radio frequency	$\pm 1.06 \times 10^{-7}$
total RF power, conducted	1.37 dB
RF power density , conducted	2.89 dB
All emissions, radiated	± 3.35 dB
Temperature	± 0.23 °C
Humidity	± 0.3 %
DC and low frequency voltages	± 0.3 %

5 Test Results

5.1 E.U.T. test conditions

Test Voltage: Input: AC 120V, 60 Hz

Temperature: 20.0 -25.0 °C

Humidity: 38-50 % RH

Atmospheric Pressure: 1000 -1010 mbar

Test frequencies and frequency range: According to the 15.31(m) Measurements on intentional radiators or receivers, other than TV broadcast receivers, shall be performed and, if required, reported for each band in which the device can be operated with the device operating at the number of frequencies in each band specified in the following table:

According to the 15.33 (a) For an intentional radiator, the spectrum shall be investigated from the lowest radio frequency signal generated in the device, without going below 9 kHz, up to at least the frequency shown in the following table:

Number of fundamental frequencies to be tested in EUT transmit band

Frequency range in which	Number of	Location in frequency range
1 MHz or less	1	Middle
1 MHz to 10 MHz	2	1 near top and 1 near bottom
More than 10 MHz	3	1 near top, 1 near middle and 1 near bottom

Frequency range of radiated emission measurements

Lowest frequency generated	Upper frequency range of measurement
9 kHz to below 10 GHz	10th harmonic of highest fundamental frequency or to 40 GHz,
At or above 10 GHz to below	5th harmonic of highest fundamental frequency or to 100 GHz,
At or above 30 GHz	5th harmonic of highest fundamental frequency or to 200 GHz,

EUT channels and frequencies list for RFID:

For 18000C config :

Channel	Frequency (MHz)	Channel	Frequency (MHz)	Channel	Frequency (MHz)
1	902.75	18	911.25	35	919.75
2	903.25	19	911.75	36	920.25
3	903.75	20	912.25	37	920.75
4	904.25	21	912.75	38	921.25
5	904.75	22	913.25	39	921.75
6	905.25	23	913.75	40	922.25
7	905.75	24	914.25	41	922.75
8	906.25	25	914.75	42	923.25
9	906.75	26	915.25	43	923.75
10	907.25	27	915.75	44	924.25
11	907.75	28	916.25	45	924.75
12	908.25	29	916.75	46	925.25
13	908.75	30	917.25	47	925.75
14	909.25	31	917.75	48	926.25
15	909.75	32	918.25	49	926.75
16	910.25	33	918.75	50	927.25
17	910.75	34	919.25		

Test frequencies are the lowest channel: 1 channel (902.75 MHz), middle channel: 26 channel (915.25 MHz) and highest channel: 50 channel (927.25 MHz)

For Railway config:

Channel	Frequency (MHz)	Channel	Frequency (MHz)	Channel	Frequency (MHz)
1	918.7	18	919.125	35	921.05
2	918.725	19	919.15	36	921.075
3	918.75	20	919.175	37	921.1
4	918.775	21	919.2	38	921.125
5	918.8	22	919.225	39	921.15
6	918.825	23	919.25	40	921.175
7	918.85	24	919.275	41	921.2
8	918.875	25	919.3	42	921.225
9	918.9	26	919.325	43	921.25
10	918.925	27	920.85	44	921.275
11	918.95	28	920.875	45	921.3
12	918.975	29	920.9	46	921.325
13	919	30	920.925	47	921.35
14	919.025	31	920.95	48	921.375
15	919.05	32	920.975	49	921.4
16	919.075	33	921	50	921.425
17	919.1	34	921.025	51	921.45

Test frequencies are the lowest channel: 1 channel (918.7 MHz), middle channel: 26 channel (919.325 MHz) and highest channel: 50 channel (921.45 MHz)

5.2 Antenna requirement

Standard requirement

15.203 requirement:

For intentional device. According to 15.203. an intentional radiator shall be designed to Ensure that no antenna other than that furnished by the responsible party shall be used with the device.

EUT Antenna

The antenna is a Patch antenna and no consideration of replacement. The best case gain of the antenna is 2.2dBi.

Test result: The unit does meet the FCC requirements.

5.3 Occupied Bandwidth

Test Requirement: FCC Part 15 C section 15.247

(a)(1)(i) The 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

Test Method: ANSI C63.10:2009 Clause 6.9 & DA 00-705

Test Status: The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.

Test Configuration:

Test Procedure:

1. Remove the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum;
2. Set the spectrum analyzer: Span = approximately 2 to 3 times the 20dB bandwidth, centring on a hopping channel;
3. Set the spectrum analyzer: RBW $\geq$ 1% of the 20dB bandwidth VBW $\geq$ RBW. Sweep = auto; Detector Function = Peak. Trace = Max Hold.
4. Mark the peak frequency and -20dB points bandwidth.

Test result (-20dB bandwidth), For RFID

For 18000C config :

Test Channel	Bandwidth(MHz)
Lowest	0.068
Middle	0.074
Highest	0.083

For Railway config:

Test Channel	Bandwidth(Hz)
Lowest	290
Middle	360
Highest	290

For RFID

For 18000C config

Result plot as follows:

Lowest Channel:

Date: 17.MAR.2015 14:19:44

Middle Channel:

Date: 17.MAR.2015 14:20:50

Highest Channel:

Date: 17.MAR.2015 14:24:07

For RFID

For Railway config

Result plot as follows:

Lowest Channel:

Middle Channel:

Highest Channel:

5.4 Carrier Frequencies Separated

Test Requirement: FCC Part 15 C section 15.247

(a),(1) Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Test Method: DA 00-705

Test Status: The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.

Test Configuration:

Test Procedure:

1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
2. Set the spectrum analyzer: RBW $\geq$ 1% of the span, VBW $\geq$ RBW,. Sweep = auto; Detector Function = Peak. Trace = Max, hold.
3. Allow the trace to stabilize. Use the marker-delta function to determine the separation between the peaks of the adjacent channels. The limit is specified in one of the subparagraphs of this Section. Submit this plot.

Test result:**For RFID****For 18000C config :**

Test Channel	Carrier Frequencies Separated	Pass/Fail
Lower Channels (channel 1 and channel 2)	0.516 MHz	Pass
Middle Channels (channel 25 and channel 26)	0.516 MHz	Pass
Upper Channels (channel 49 and channel 50)	0.504 MHz	Pass
Remark: The limit is maximum the 20 dB bandwidth: 0.083 MHz		

For Railway config:

Test Channel	Carrier Frequencies Separated	Pass/Fail
Lower Channels (channel 1 and channel 2)	0.025 MHz	Pass
Middle Channels (channel 25 and channel 26)	0.025 MHz	Pass
Upper Channels (channel 50 and channel 51)	0.025 MHz	Pass
Remark: The limit is maximum the 20 dB bandwidth: 360 Hz		

For RFID
For 1800C config

1. Lowest Channels:

2. Middle Channels:

3. Highest Channels

5.5 Hopping Channel Number

Test Requirement: FCC Part15 C section 15.247

(b)(2)For frequency hopping systems operating in the 902–928 MHz band: 1watt for systems employing at least 50 hopping channels;

Test Method: DA 00-705

Test Status: The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.

Test Configuration:

Test Procedure:

1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
2. Set the spectrum analyzer: RBW = 100 kHz. VBW = 300 kHz. Sweep = auto; Detector Function = Peak. Trace = Max hold.
3. Allow the trace to stabilize. It may prove necessary to break the span up to sections. in order to clearly show all of the hopping frequencies. The limit is specified in one of the subparagraphs of this Section.
4. Set the spectrum analyzer: start frequency =900 MHz. stop frequency = 930 MHz. Submit the test result graph.

For RFID
For 18000C config

Test result: Total channels are 50 channels.

Date: 10.FEB.2015 16:22:39

For Railway config

Test result: Total channels are 51 channels.

Test result: The unit does meet the FCC requirements.

5.6 Dwell Time

Test Requirement: FCC Part 15 C section 15.247

(a)(1)(i) For frequency hopping systems operating in the 902–928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period

Test Method: DA 00-705

Test Status: The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.

Test Configuration:

Test Procedure:

1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
2. Set spectrum analyzer span = 0. centered on a hopping channel;
3. Set RBW = 1 MHz and VBW = 1 MHz. Sweep = as necessary to capture the entire dwell time per hopping channel. Detector Function = Peak. Trace = View;
4. Use the marker-delta function to determine the dwell time. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.). Repeat this test for each variation. The limit is specified in one of the subparagraphs of this Section. Submit this plot(s). An oscilloscope may be used instead of a spectrum analyzer.

Test Result:

For RFID

For 18000C config

1. Channel 1: 902.75 MHz

Test Data

Date: 17.MAR.2015 18:03:59

Average Time of Occupancy

Event duration=103ms

Date: 17.MAR.2015 17:44:46

Figure 1: Number of events in 20sec

Sweep time = Event duration * Number of event in 20s = 103ms * 1 = 103ms

The results are not greater than 0.4 seconds

Test Data

Event duration=96ms

Date: 5.MAY.2015 10:26:12

Average Time of Occupancy

Event duration=48ms

Date: 5.MAY.2015 10:29:40

Figure 2: Number of events in 20.4 sec

Sweep time = Event duration * Number of event in 20.4s = 48ms * 4 = 192ms

The results are not greater than 0.4 seconds

The unit does meet the FCC requirements.

5.7 Maximum Peak Output Power

Test Requirement: FCC Part 15 C section 15.247
(b)(2) For frequency hopping systems operating in the 902–928 MHz band: 1watt for systems employing at least 50hopping channels;

Test Method: ANSI C63.10:2009 Clause 6.10 & DA 00-705

Test mode: The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.

Test Configuration:

Test Procedure:

1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
2. Set the spectrum analyzer: RBW = 3 MHz. VBW = 3 MHz. Sweep = auto; Detector Function = Peak.
3. Keep the EUT in transmitting at lowest, medium and highest channel individually. Record the max value.

Test Result: (For RFID)				
For 18000C config :				
Test Channel	Fundamental Frequency (MHz)	Output Power (dBm)	Limit (dBm)	Result
Lowest	902.75	20.86	30	Pass
Middle	915.25	20.02	30	Pass
Highest	927.25	19.07	30	Pass
For Railway config:				
Test Channel	Fundamental Frequency (MHz)	Output Power (dBm)	Limit (dBm)	Result
Lowest	918.7	26.50	30	Pass
Middle	919.325	26.77	30	Pass
Highest	921.45	26.46	30	Pass
Test result: The unit does meet the FCC requirements.

5.8 Conducted Spurious Emissions

Test Requirement: FCC Part15 C section 15.247

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating. The radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Based on either an RF conducted or a radiated measurement. Provided the transmitter demonstrates compliance with the peak conducted power limits.

Test Method: ANSI C63.10: 2009 Clause 6.7 & DA 00-705

Test Status: The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.

Test Configuration:

Test Procedure:

1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
2. Set the spectrum analyzer: RBW = 100 kHz. VBW $\geq$ RBW. Sweep = auto; Detector Function = Peak (Max. hold).

5.9 Radiated Spurious Emissions

Test Requirement:	FCC Part15 C section 15.247 (d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating. The radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that Contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, and provided the transmitter demonstrates compliance with the peak conducted power limits.
Test Method:	ANSI C63.10: 2009 Clause 6.4, 6.5 and 6.6 & DA 00-705
Test Status:	The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.
Detector:	For PK value: RBW = 1 MHz for $f \geq 1$ GHz, 100 kHz for $f < 1$ GHz, 9kHz for <30 MHz VBW $\geq$ RBW Sweep = auto Detector function = peak Trace = max hold For AV value: RBW = 1 MHz for $f \geq 1$ GHz, 100 kHz for $f < 1$ GHz, 9kHz for <30 MHz VBW =10 Hz Sweep = auto Detector function = peak Trace = max hold
15.209 Limit:	40.0 dB μ V/m between 30MHz & 88MHz 43.5 dB μ V/m between 88MHz & 216MHz 46.0 dB μ V/m between 216MHz & 960MHz 54.0 dB μ V/m above 960MHz

Test Configuration:

- 1) 9kHz to 30MHz emissions:

- 2) 30 MHz to 1 GHz emissions:

3) 1 GHz to 40 GHz emissions:

Test Procedure: The procedure used was ANSI Standard C63.4:2003. The receiver was scanned from 30MHz to 25GHz. When an emission was found, the table was rotated to produce the maximum signal strength. An initial pre-scan was performed for in peak detection mode using the receiver. The EUT was measured for both the Horizontal and Vertical polarities and performed a pre-test three orthogonal planes. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. After pre-test, it was found that the worst radiation emission was get at the X position. So the data shown was the X position only. The worst case emissions were reported.

Now set the VBW to 10 Hz, while maintaining all of the other instrument settings. This peak level, once corrected, must comply with the limit specified in Section 15.209. If the dwell time per channel of the hopping signal is less than 100 ms, then the reading obtained with the 10 Hz VBW may be further adjusted by a "duty cycle correction factor", derived from $20\log(\text{dwell time}/100 \text{ ms})$, in an effort to demonstrate compliance with the 15.209 limit.

Submit this data.

Frequency (MHz)	Antenna factors (dB/m)	Cable loss (dB)	Preamp factor (dB)	Reading Level (dBμV)	Emission Level (dBμV/m)	Limit (dBμV/m)	Antenna polarization

Average Measurement:

Frequency (MHz)	Antenna factors (dB/m)	Cable loss (dB)	Preamp factor (dB)	Reading Level (dBμV)	Emission Level (dBμV/m)	Limit (dBμV/m)	Antenna polarization

No emission above 1GHz was found during the test.

5.10 Band Edges Requirement

Test Requirement: FCC Part15 C section 15.247

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

Frequency Band: 902-928 MHz

Test Method: ANSI C63.10:2009 Clause 6.9 & DA 00-705

Test Status: The program used to control the EUT for staying in continuous transmitting and receiving mode is programmed. For 18000C config channel lowest (902.75MHz), middle (915.25MHz) and highest (927.25MHz) are chosen for full testing. For Railway config channel lowest (918.7MHz), middle (919.325MHz) and highest (921.45MHz) are chosen for full testing.

Test Configuration:

Test Procedure:

Set RBW of spectrum analyzer to 100 kHz and VBW of spectrum analyzer to 300 kHz with suitable frequency span including 100 kHz bandwidth from band edge.

The band edges was measured and recorded Result:

The Lower Edges attenuated more than 20dB.

The Upper Edges attenuated more than 20dB.

The graph as below. Represents the emissions take for this device.

For RFID

For 18000C config

Low channel:

Date: 10.FEB.2015 17:51:03

High channel:

Date: 10.FEB.2015 17:52:58

Low channel:

Date: 17.MAR.2015 17:54:44

High channel:

Date: 17.MAR.2015 17:59:11

For RFID

For 18000C config

Low channel:

High channel:

Low channel:

Date: 5.MAY.2015 09:46:22

High channel:

Date: 5.MAY.2015 10:53:15

Test result: The unit does meet the FCC requirements.

5.11 Conducted Emissions at Mains Terminals 150 kHz to 30 MHz

Test Requirement: FCC Part 15 C section 15.207

Test Method: ANSI C63.10:2009 Clause 6.2 & DA 00-705

Frequency Range: 150 kHz to 30 MHz

Detector: Peak for pre-scan (9 kHz Resolution Bandwidth)

Test Limit

Limits for conducted disturbance at the mains ports of class B

Frequency Range	Class B Limit dB(μV)	
	Quasi-peak	Average
0.15 to 0.50	66 to 56	56 to 46
0.50 to 5	56	46
5 to 30	60	50
NOTE 1 The limit decreases linearly with the logarithm of the frequency in the range 0,15 MHz to 0,50 MHz.		

EUT Operation:

Test in normal operating mode. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Test Configuration:**Test procedure:**

1. The mains terminal disturbance voltage test was conducted in a shielded room.
2. The tabletop EUT was placed upon a non-metallic table 0.8m above the ground reference plane. And for floor-standing arrangement, the EUT was placed on the horizontal ground reference plane, but separated from metallic contact with the ground reference plane by 0.1m of insulation.

5.11.1 Measurement Data

An initial pre-scan was performed on the live and neutral lines with peak detector.

Quasi-Peak and Average measurement were performed at the frequencies with maximized peak emission were detected. For EUT the communicating was worst case mode.

The following Quasi-Peak and Average measurements were performed on the EUT Live line

Peak Scan:

Level (dBμV)

Quasi-peak and Average measurement

NO.	Freq MHz	Level dBμV	Remark	LISN Factor dB	Cable Loss dB	Limit Line dBμV	Over Limit dB
