ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC CFR 47: Part 80 and RSS-182. The sample tested was found to comply with the requirements defined in the applied rules.

REPORT SUMMARY

FCC and Industry Canada Testing of the
SRT Marine Technology Ltd
Class A AIS Transceiver

1.1 INTRODUCTION

The information contained in this report is intended to show verification of the SRT Marine Technology Ltd Class A AIS Transceiver to the requirements of FCC CFR 47 Part 80 and RSS-182.

Objective	To perform FCC and Industry Canada Testing to determine the Equipment Under Test's (EUT's) compliance with the Test Specification for the series of tests carried out.
Manufacturer	SRT Marine Technology Ltd
Model Number(s)	POSIEDON
Serial Number(s)	Not Serialised (TUV_0003) Not Serialised (TUV_0021)
Software Version	V33
Hardware Version	V2
Number of Samples Tested	Two

1.5 PRODUCT INFORMATION

1.5.1 Technical Description

The Equipment Under Test (EUT) was an SRT Marine Technology Ltd Class A AIS Transceiver as shown in the photograph below. A full technical description can be found in the Manufacturers documentation.

Equipment Under Test

1.5.2 Test Configuration

The EUT was configured in accordance with FCC CFR 47 Part 80 and RSS-182.

1.5.3 EUT Cable / Port Identification

Port Type	Identification / Type	No. Off	Max Cable Length
Serial Communications	NMEA2000	1	1M
Serial Communications	RS-232	1	1M
Power	DC Power	1	1M
Serial Communications	Pilot	1	1M
RF Communications	VHF	1	>1M
RF Communications	GPS	1	>1M
Serial Communications	50-Way D-Type	1	1M

1.5.4 Modes of Operation

Modes of operation of each EUT during testing were as follows:

Mode 1 - Transmit

Mode 2 - Receive

Information on the specific test modes utilised are detailed in the test procedure for each individual test.

1.6 TEST CONDITIONS

For all tests the EUT was set up in accordance with the relevant test standard and to represent typical operating conditions. Tests were applied with the EUT situated in a shielded enclosure, test laboratories or an open test area as appropriate.

The EUT was powered from a 12V DC supply unless otherwise stated.

1.7 DEVIATIONS FROM THE STANDARD

No deviations from the applicable test standards or test plan were made during testing.

1.8 MODIFICATION RECORD

The table below details modifications made to the EUT during the test programme. The modifications incorporated during each test are recorded on the appropriate test pages.

2.1.3 Date of Test and Modification State

05 March 2010 - Modification State 2

2.1.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.1.5 Test Procedure

Test performed in accordance with ANSI C63.4, FCC Part 80 and RSS-182.

A preliminary profile of the Spurious Radiated Emissions were obtained by operating the EUT on a remotely controlled turntable within a semi-anechoic chamber. Measurements of emissions from the EUT were obtained with the measuring antenna in both horizontal and vertical polarisations. The profiling produced a list of the worse case emissions from the EUT.

Using the information from the preliminary profiling of the EUT, the list of emissions were then confirmed or updated under the alternative open site conditions. Emission levels were maximised by adjusting the antenna height, antenna polarisation and turntable azimuth.

Emissions recorded in the procedure described above over the range 30 MHz to 2 GHz were then formally measured using a peak detector. This was deemed the worst case and where emissions exceeded the limit, the measurement procedure was carried out in accordance with ANSI C63.4.

< 1 GHz – Quazi Peak Detector
> 1 GHz – Average

The EUT was operated at its maximum power level on the bottom and top channels with PRBS modulation.

The measurements were performed at a 3m distance unless otherwise stated.

The major items of test equipment used for the above tests are identified in Section 3.1.

2.6.5 Test Procedure

Using a spectrum analyser, the emissions were measured between the range 9kHz and 2GHz. The path loss between the EUT and spectrum analyser was measured and the highest value of attenuation across the range was entered as a reference level offset. The RBS was set to 30kHz and the VBW to 100kHz. Due to the burst nature of the signal, the spectrum analyser was set to measure only during the burst. The trace was set to max hold and a peak detector used (worst case). The plots are shown on the following pages.
