Competences and guarantees

AT4 wireless is a testing laboratory accredited by the National Accreditation Body (ENAC -Entidad Nacional de Acreditación), to perform the tests indicated in the Certificate No. 51/LE 147.

AT4 wireless is a laboratory with a measurement facility in compliance with the requirements of Section 2.948 of the FCC rules and has been added to the list of facilities whose measurements data will be accepted in conjunction with applications for Certification under Parts 15 or 18 of the Commission's Rules. Registration Number: 720267.

In order to assure the traceability to other national and international laboratories, AT4 wireless has a calibration and maintenance program for its measurement equipment.

AT4 wireless guarantees the reliability of the data presented in this report, which is the result of the measurements and the tests performed to the item under test on the date and under the conditions stated on the report and, it is based on the knowledge and technical facilities available at AT4 wireless at the time of performance of the test.

AT4 wireless is liable to the client for the maintenance of the confidentiality of all information related to the item under test and the results of the test.

The results presented in this Test Report apply only to the particular item under test established in this document.

IMPORTANT: No parts of this report may be reproduced or quoted out of context, in any form or by any means, except in full, without the previous written permission of AT4 wireless.

General conditions

1. This report is only referred to the item that has undergone the test.
2. This report does not constitute or imply on its own an approval of the product by the Certification Bodies or competent Authorities.
3. This document is only valid if complete; no partial reproduction can be made without previous written permission of AT4 wireless.
4. This test report cannot be used partially or in full for publicity and/or promotional purposes without previous written permission of AT4 wireless and the Accreditation Bodies.

Uncertainty

Uncertainty (factor $k=2$) was calculated according to the AT4 wireless internal document PODT000.

Usage of samples

Samples undergoing test have been selected by: **the client**.

Sample S/01 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
51746/027	Satellite Smartphone	Mx Rugged B (SSD-52)	---	2017-01-16
51746/028	Battery	9304576A01	---	2017-01-16
51746/038	Antenna	---	---	2017-01-16

1. Sample S/01 has undergone the test(s).
All radiated tests indicated in appendix A.

Sample S/02 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
51746/027	Satellite Smartphone	Mx Rugged E (SSD-53)	---	2017-01-16
51746/020	Dummy battery	DB-6BM proto 0.1	162510006	2017-01-16

1. Sample S/02 has undergone the test(s).

All conducted tests indicated in appendix A.

Test sample description

The Rugged B is a satellite phone targeted for professional Public Safety use.

Identification of the client

Bittium Wireless Ltd.

Tutkijantie 8 90590 Oulu, Finland

Testing period

The performed test started on 2017-01-19 and finished on 2017-02-17.

The tests have been performed at AT4 wireless.

Environmental conditions

In the control chamber, the following limits were not exceeded during the test:

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %
Shielding effectiveness	> 100 dB
Electric insulation	> 10 kΩ
Reference resistance to earth	< 1 Ω

In the semianechoic chamber, the following limits were not exceeded during the test.

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %
Air pressure	Min. = 860 mbar Max. = 1060 mbar
Shielding effectiveness	> 100 dB
Electric insulation	> 10 kΩ
Reference resistance to earth	< 1 Ω
Normal site attenuation (NSA)	< ±4 dB at 10 m distance between item under test and receiver antenna, (30 MHz to 1000 MHz)
Field homogeneity	More than 75% of illuminated surface is between 0 and 6 dB (26 MHz to 1000 MHz).

In the chamber for conducted measurements, the following limits were not exceeded during the test:

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %
Air pressure	Min. = 860 mbar Max. = 1060 mbar
Shielding effectiveness	> 100 dB
Electric insulation	> 10 kΩ
Reference resistance to earth	< 1 Ω

Remarks and comments

1: Conducted RF measurements were performed with model Mx Rugged E which has the same Satellite radio module as model Mx Rugged B.

2: Used instrumentation:

TEST CONDITIONS

Power supply (V):

$$V_{\text{nom}} = 4.2 \text{ Vdc}$$

$$V_{\text{max}} = 4.2 \text{ Vdc}$$

$$V_{\text{min}} = 3.6 \text{ Vdc}$$

The subscripts nom, min and max indicate voltage test conditions (nominal, minimum and maximum respectively, as declared by the applicant).

Type of power supply = DC Voltage from rechargeable battery

Type of antenna = Quadrifilar helix 1525 – 1660.5MHz (+2.4 dBi).

TEST FREQUENCIES:

pi/2 BPSK voice 31.25kHz bandwidth:

Lowest channel: 1626.53125 MHz

Middle channel: 1643.5 MHz

Highest channel: 1660.46875 MHz

pi/4 QPSK packet data 31.25kHz bandwidth:

Lowest channel: 1626.53125 MHz

Middle channel: 1643.5 MHz

Highest channel: 1660.46875 MHz

pi/4 QPSK packet data 62.5kHz bandwidth:

Lowest channel: 1626.546875 MHz

Middle channel: 1643.515625 MHz

Highest channel: 1660.484375 MHz

pi/4 QPSK packet data 156.25kHz bandwidth:

Lowest channel: 1626.59375 MHz

Middle channel: 1643.5 MHz

Highest channel: 1660.40625 MHz

Occupied Bandwidth.

METHOD

The occupied bandwidth measurement was performed at the output terminals of the EUT using an attenuator power and a spectrum analyser. The EUT was set in continuous transmission with modulations and associated bandwidths.

The 99% occupied bandwidth and the -26 dBc bandwidth were measured directly using the built-in bandwidth measuring option of spectrum analyser.

TEST SETUP

RESULTS

pi/2 BPSK voice 31.25kHz bandwidth:

	Lowest frequency 1626.53125 MHz	Middle frequency 1643.5 MHz	Highest frequency 1660.46875 MHz
99% bandwidth (kHz)	27.418	27.703	27.342
-26 dBc bandwidth (kHz)	31.782	31.994	31.641
Measurement uncertainty (kHz)	<± 0.17		

pi/4 QPSK packet data 31.25kHz bandwidth:

	Lowest frequency 1626.53125 MHz	Middle frequency 1643.5 MHz	Highest frequency 1660.46875 MHz
99% bandwidth (kHz)	27.390	27.118	26.854
-26 dBc bandwidth (kHz)	30.649	30.898	30.845
Measurement uncertainty (kHz)	<± 0.17		

pi/4 QPSK packet data 62.5kHz bandwidth:

	Lowest frequency 1626.546875 MHz	Middle frequency 1643.515625 MHz	Highest frequency 1660.484375 MHz
99% bandwidth (kHz)	56.636	55.585	55.573
-26 dBc bandwidth (kHz)	70.614	63.368	63.979
Measurement uncertainty (kHz)	<± 0.33		

pi/4 QPSK packet data 156.25kHz bandwidth:

FCC 25.202 Subclause (d) / Frequency tolerance, Earth stations.

SPECIFICATION

§25.202 (d).

The carrier frequency of each earth station transmitter authorized in these services shall be maintained within 0.001 percent of the reference frequency.

METHOD

The frequency tolerance measurements over temperature variations were made over the temperature range of -30°C to $+50^{\circ}\text{C}$. The EUT was placed inside a climatic chamber and the temperature was raised hourly in 10°C steps from -30°C up to $+50^{\circ}\text{C}$.

The supply voltage was varied between the extreme voltages declared by the applicant.

The EUT was set in continuous transmission with modulation (BPSK and QPSK), in the middle channel and the maximum frequency error was measured using a spectrum analyser.

The DC supply voltage is applied using an external calibrated power supply.

TEST SETUP

RESULTS

pi/2 BPSK voice 31.25kHz bandwidth:

Nominal frequency: 1643.5 MHz

Frequency stability over temperature variations.

Temperature (°C)	Frequency Error (Hz)	Frequency Error (ppm)	Frequency Error (%)
+50	654.882	0.39847	0.000039

Measurement uncertainty	$< \pm 1 \times 10^{-6}$
-------------------------	--------------------------

Verdict: PASS

FCC 25.204 Subclause (a) / Power Limits for earth stations (radiated e.i.r.p.).

SPECIFICATION

§25.204 (a)

In bands shared coequally with terrestrial radio communication services, the equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station, other than an ESV, operating in frequency bands between 1 and 15 GHz, shall not exceed the following limits except as provided for in paragraph (c) of this section:

+40 dBW (70 dBm) in any 4 kHz band for $\theta \leq 0^\circ$
+40 + 3 θ dBW in any 4 kHz band for $0^\circ < \theta \leq 5^\circ$

where θ is the angle of elevation of the horizon viewed from the center of radiation of the antenna of the earth station and measured in degrees as positive above the horizontal plane and negative below it.

(c) For angles of elevation of the horizon greater than 5° there shall be no restriction as to the equivalent isotropically radiated power transmitted by an earth station towards the horizon.

METHOD

The EUT RF output connector was connected to a spectrum analyser using a 50 ohm attenuator and it is set in continuous transmission with different modes of modulation and nominal bandwidths.

The maximum equivalent isotropically radiated power e.i.r.p. is calculated by adding the declared maximum antenna gain (dBi respectively).

TEST SETUP

RESULTS

MAXIMUM OUTPUT POWER IN 4 kHz. See next plots.

Declared maximum antenna gain: 2.4 dBi.

The EIRP power (dBm) is calculated by adding the declared maximum antenna gain to the measured conducted power.

pi/2 BPSK voice 31.25kHz bandwidth:

	Lowest frequency 1626.53125 MHz	Middle frequency 1643.5 MHz	Highest frequency 1660.46875 MHz
Maximum peak power (dBm)	25.51	25.71	25.59
Maximum EIRP power (dBm)	27.91	28.11	27.99
Measurement uncertainty (dB)	<± 0.66		

pi/4 QPSK packet data 31.25kHz bandwidth:

	Lowest frequency 1626.53125 MHz	Middle frequency 1643.5 MHz	Highest frequency 1660.46875 MHz
Maximum peak power (dBm)	27.40	27.53	27.46
Maximum EIRP power (dBm)	29.80	29.93	29.85
Measurement uncertainty (dB)	<± 0.66		

pi/4 QPSK packet data 62.5kHz bandwidth:

	Lowest frequency 1626.546875 MHz	Middle frequency 1643.515625 MHz	Highest frequency 1660.484375 MHz
Maximum peak power (dBm)	21.16	21.73	21.41
Maximum EIRP power (dBm)	23.56	24.13	23.81
Measurement uncertainty (dB)	<± 0.66		

pi/4 QPSK packet data 156.25kHz bandwidth:

	Lowest frequency 1626.59375 MHz	Middle frequency 1643.5 MHz	Highest frequency 1660.40625 MHz
Maximum peak power (dBm)	17.59	17.70	17.65

FCC 25.202 Subclause (f) / Emission limitations. Emission mask.

SPECIFICATION

§2.1051 and §25.202 (f).

METHOD

The EUT RF output connector was connected to a spectrum analyser using a 50 ohm attenuator and it is set in continuous transmission with different modes of modulation and nominal bandwidths.

The reading of the spectrum analyser is corrected with the attenuation loss of connection between output terminal of EUT and input of the spectrum analyser.

The emission masks were measured using the built-in spectrum mask measurement function of the spectrum analyser.

Measurement Limit:

The mean power of emissions shall be attenuated below the mean output power of the transmitter in accordance with the following schedule:

- (1) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: 25 dB;
- (2) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: 35 dB;
- (3) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 250 percent of the authorized bandwidth: An amount equal to 43 dB plus 10 times the logarithm (to the base 10) of the transmitter power in watts;

At P_o transmitting power, the specified minimum attenuation becomes $43 + 10 \log(P_o)$, and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [43 + 10 \log(P_o \text{ in mwatts}) - 30] = -13 \text{ dBm}$$

TEST SETUP

RESULTS (see plots in next pages)

Measurement uncertainty (dB)	<±0.66

FCC 25.202 Subclause (f) / Emission limitations. Spurious emissions at antenna terminals.

SPECIFICATION

§2.1051 and §25.202 (f).

METHOD

The EUT RF output connector was connected to a spectrum analyser using a 50 ohm attenuator and it is set in continuous transmission with different modes of modulation and nominal bandwidths. The spectrum was investigated from 9 kHz to 18 GHz using a resolution bandwidth (RBW) of 100 kHz.

The reading of the spectrum analyser is corrected with the attenuation loss of connection between output terminal of EUT and input of the spectrum analyser.

Each emission detected is re-measured using a resolution bandwidth of 4 kHz to compare with the limit.

Measurement Limit:

According to specification, in any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 250 percent of the authorized bandwidth: An amount equal to 43 dB plus 10 times the logarithm (to the base 10) of the transmitter power in watts.

At P_o transmitting power, the specified minimum attenuation becomes $43+10\log(P_o)$, and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [43 + 10 \log(P_o \text{ in mwatts}) - 30] = -13 \text{ dBm}$$

TEST SETUP

RESULTS (see plots in next pages)

pi/2 BPSK voice 31.25kHz bandwidth:

Lowest Channel

Spurious frequency (GHz)	Level (dBm)	Measurement uncertainty (dB)
3.2524	-26.53	< ± 2.33

Middle Channel

Spurious frequency (GHz)	Level (dBm)	Measurement uncertainty (dB)

FCC 25.202 Subclause (f) / Emission limitations. Radiated emissions.

SPECIFICATION

§ 25.202 (f).

METHOD

The spectrum was scanned from 30 MHz to at least the 10th harmonic of the highest frequency generated within the equipment, using a resolution bandwidth (RBW) of 10 kHz in the range 30 MHz to 1 GHz and 100 kHz in the range 1 GHz to 18 GHz.

Detected emissions were maximized at each frequency by rotating the EUT and adjusting the measuring antenna height and polarization. The maximum meter reading was recorded.

Each detected emissions is re-measured with 4 kHz and the emissions at less than 20 dB respect to the limits are substituted by the Substitution method, in accordance with the ANSI/TIA/EIA-603-D: 2010.

The test was performed with the equipment transmitting first in only Satellite mode and repeated with the BT EDR/BT LE (modulation GFSK) radio transmitting simultaneously to check the impact of the co-location of both radio interfaces. The results and plots below show the worst results obtained in both modes.

Measurement Limit:

According to specification, in any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 250 percent of the authorized bandwidth: An amount equal to 43 dB plus 10 times the logarithm (to the base 10) of the transmitter power in watts.

At P_o transmitting power, the specified minimum attenuation becomes $43+10\log(P_o)$, and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [43 + 10 \log(P_o \text{ in mwatts}) - 30] = -13 \text{ dBm.}$$

TEST SETUP

All radiated tests were performed in an anechoic chamber. The measurement antenna is situated at a distance of 3 m for the frequency range 30 MHz-1000 MHz (30 MHz-1000 MHz Bilog antenna) and at a distance of 1m for the frequency range 1 GHz-18 GHz (1 GHz-18 GHz Double ridge horn antenna).

For radiated emissions in the range 1 GHz-18 GHz that is performed at a distance closer than the specified distance, an inverse proportionality factor of 20 dB per decade is used to normalize the measured data for determining compliance.

The equipment under test was set up on a non-conductive platform above the ground plane and the situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

Radiated measurements setup $f < 1$ GHz

Radiated measurements setup $f > 1$ GHz

RESULTS

Preliminary tests were done with the equipment operating with the different possible modulations and bandwidths and the worst case was pi/2 BPSK modulation and nominal bandwidth of 31.25 kHz. Results shown below correspond to pi/2 BPSK modulation and nominal bandwidth of 31.25 kHz.

1. CHANNEL: LOWEST

Frequency range 30 MHz-1000 MHz.

No spurious signals were found in all the range.

Frequency range 1 GHz-18 GHz.

No radiated spurious signals were detected at less than 20 dB respect to the limit.

2. CHANNEL: MIDDLE

Frequency range 30 MHz-1000 MHz.

No spurious signals were found in all the range.

Frequency range 1 GHz-18 GHz.

No radiated spurious signals were detected at less than 20 dB respect to the limit.

3. CHANNEL: HIGHEST

Frequency range 30 MHz-1000 MHz.

No spurious signals were found in all the range.

Frequency range 1 GHz-18 GHz.

No radiated spurious signals were detected at less than 20 dB respect to the limit.

Measurement uncertainty (dB)	<±3.88 for $f < 1\text{GHz}$ <±4.87 for $f \geq 1\text{GHz}$ up to 18 GHz
------------------------------	--

Verdict: PASS

FREQUENCY RANGE 30 MHz-1000 MHz.

Note: The limit shown in the plot is extrapolated for 10 kHz measurement bandwidth.

(This plot is valid for all three channels)

FREQUENCY RANGE 1 GHz to 3 GHz.

CHANNEL: LOWEST

Note: The peak above the limit is the carrier frequency. The limit shown in the plot is extrapolated for 100 kHz measurement bandwidth.

CHANNEL: MIDDLE

FCC 25.216 Subclause (f) / Limits on emissions from mobile earth stations for protection of aeronautical radionavigation satellite service

SPECIFICATION

§ 25.216 (c), (h) & (i).

METHOD

For measurements in transmission mode, the EUT is set in continuous transmission with different modes of modulation and nominal bandwidths.

Preliminary tests were done with the equipment operating with the different possible modulations and bandwidths and the worst case was for pi/2 BPSK modulation and nominal bandwidth of 31.25 kHz. Results shown below correspond to pi/2 BPSK modulation and nominal bandwidth of 31.25 kHz.

The spectrum was investigated in the range of frequencies between 1559 MHz and 1610 MHz.

Detected emissions were maximized at each frequency by rotating the EUT and adjusting the measuring antenna height and polarization. The maximum meter reading was recorded.

Each detected emission at less than 20 dB below the limit were substituted by the Substitution method, in accordance with the ANSI/TIA/EIA-603-D: 2010.

The test was performed with the equipment transmitting first in only Satellite mode and repeated with the BT EDR/BT LE (modulation GFSK) radio transmitting simultaneously to check the impact of the co-location of both radio interfaces. The results and plots below show the worst results obtained in both modes.

TEST SETUP

All radiated tests were performed in an anechoic chamber. The measurement antenna is situated at a distance of 1m for the frequency range 1559 MHz and 1610 MHz (1 GHz-18 GHz Double ridge horn antenna).

For radiated emissions in the range 1559 MHz and 1610 MHz that is performed at a distance closer than the specified distance, an inverse proportionality factor of 20 dB per decade is used to normalize the measured data for determining compliance.

The equipment under test was set up on a non-conductive platform above the ground plane and the situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

See block diagrams above.

RESULTS

Frequency range 1559 MHz-1610 GHz.

1. Transmission state.
