3. SUMMARY OF TEST RESULTS

The following table represents the list of measurements required under the FCC CFR47 Part 22, 24.

FCC Rules	Test Items	Results
22.913(a), 24.232(c)	ERP & EIRP	Pass
22.917, 24.238	Radiated Spurious Emissions	Pass
15.207	AC Line Conducted Emission	Pass

*refer to the SAR report for conducted powers.

*According to the measured results to maximum output power, the EUT was tested with GSM & WCDMA mode of GSM/GPRS/EDGE & WCDMA/HSDPA/HSUPA as worst cases.

Note:

- Conducted test items are not performed according to reduced test plan.
- The GSM/WCDMA module reports is used for FCC certification.
- So only the radiated emission test items are performed.

4. Measurement & Results

4.1. Effective Radiated Power

4.1.1. Test Procedure

The radiated and spurious measurements were made Fully-anechoic chamber at a 3-meter test range. The EUT was placed on the rotating device at 1.5m and at a distance of 3-meters from the receive antenna. The rotating device which can rotate horizontal axis was mounted on the turn unit to facilitate rotation around a vertical axis. The measurement was made for each horizontal/vertical position combination with receive antenna horizontally polarized. This measurement was repeated with receive antenna vertically polarized. The substitution antenna will replace the EUT antenna it the same position and in vertical polarization. The frequency of the signal generator shall be set to the frequencies that were measured on the EUT. The signal generator, output level, shall be adjusted until an equal or a known related level to what was measured from the EUT is obtained in the spectrum analyzer. This level was recorded. For readings above 1 GHz, the above procedure is repeated using horn antennas and the difference between the gain of the horn and an isotropic antenna are taken into consideration.

All modes of operation were investigated, and the worst-case results are reported.

4.1.2. Limit

FCC 22.913(b) : The Effective Radiated Power (ERP) of mobile transmitters must not exceed 7 Watts.

FCC 24.232(b) : The equivalent Isotropic Radiated Power (EIRP) must not exceed 2 Watts.

4.1.3. ERP Sample Calculation

Frequency(M Hz)	Measured Level [dBm]	Substitute Level(dBm)	Ant Gain (dBd)	Cable Loss (dB)	Polarization [H/V]	ERP [dBm]
824.2	-22.17	31.01	-0.48	1.05	H	32.54

$$\begin{aligned}
 \text{ERP} &= \text{Substitute Level (dBm)} - \text{Ant. Gain} - \text{Cable Loss} \\
 &= 31.01 - (-0.48) + 1.05 = 30.42
 \end{aligned}$$

NOTES:

This device was tested under all configurations and the highest power is reported. Also, we have done x, y, z planes in EUT and horizontal and vertical polarization in detecting antenna.

For GSM signal, and NADC TDMA signals, a peak detector is used, with RBW = VBW = 1 MHz.

For WFDMA signal, a peak detector is used, with RBW = VBW = 5 MHz.

4.3. AC Conducted Emissions

4.3.1. Test Procedure

Conducted emission measurements on the EUT were performed by "AC Power Line Conducted Emissions Testing" procedure as per ANSI C63.4. The EUT was set up on a wooden table 0.8 meters height, 1.0 by 1.5 meters in size, placed in the shielded enclosed with a side of wall of which constituted a vertical conducting surface of 2.2 m x 3.1 m in size to maintain 40 cm from the rear of EUT

LISN(Line Impedance Stabilization Network, ROHDE & SCHWARZ, ESH3-Z5, 50 ohm / 50 μ H) was installed and electrically boned to the conducting ground plane. The EUT was connected to the LISN using a typical power adapter.

One of two 50 ohm output terminals of the LISN was connected to the EMI Receiver (ROHDE & SCHWARZ, ESCI, 9 kHz to 3 GHz) and the other was terminated in 50 ohms. Measurements were again performed after interchanging such a connection oppositely.

The frequency range from 150 kHz to 30 MHz was examined and the remarkable frequencies were measured with Quasi-peak and Average values using the EMI receiver instrument (ROHDE & SCHWARZ, ESI, 9 kHz to 3 GHz ; Detector Function ; CISPR Quasi-Peak & Average). The 6 dB bandwidth of the Receiver was set to 9 kHz

The position of connecting cables of the EUT was changed to find the worst case configuration during measurements. The maximum emission level from the EUT occurred in such configuration as shown in the following photograph.

4.3.2. Limits

Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Frequency (MHz)	Conducted Limits (dBuV)	
	Quasi-peak	Average
0.15-0.5	66 to 56 *	56 to 46 *
0.5-5	56	46
5-30	60	50

- Decreases with the logarithm of the frequency.

4.3.3. Sample calculation

The emission level measured in decibels above one microvolt ($\text{dB}\mu\text{V}$) was converted into microvolt (μV) as shown in following sample calculation.

For example :

Measured Value at	0.2130 MHz	47.6 $\text{dB}\mu\text{V}$ @ Q-Peak mode
+ Correct factor *		9.8 dB
= Conducted Emission		57.4 $\text{dB}\mu\text{V}$

* Correct factor is adding RF cable loss and Attenuation
