TEST DESCRIPTION

Measurements were performed in a semi-anchoic chamber. RF absorbing cones were placed on the floor between the measurement antenna and the AUT. The AUT was placed on a 1.8 m high block of foam.

The reference antenna was placed at the center of the 1.8 m block of foam. A CW signal was provided to the reference antenna from a calibrated signal generator through a length of RF Cable. To reduce the effects of the RF cable, the RF cable was lined with ferrite cores running down the length of the cable with a spacing of 10cm between each ferrite. A reference plot was collected.

The AUT was then put into the chamber in place of the reference antenna. The AUT was connected to the signal generator using the RF same cable and connector setup. A polar plot was then collected at the antenna height of maximum field strength. This plot was then compared to the reference antenna scan, and, using the antenna gain (dBi) of the reference antenna the absolute gain of the AUT was calculated.

TEST DESCRIPTION

Measurements were performed in a semi-anchoic chamber. RF absorbing cones were placed on the floor between the measurement antenna and the AUT. The AUT was placed on a 1.8 m high block of foam.

The reference antenna was placed at the center of the 1.8 m block of foam. A CW signal was provided to the reference antenna from a calibrated signal generator through a length of RF Cable. To reduce the effects of the RF cable, the RF cable was lined with ferrite cores running down the length of the cable with a spacing of 10cm between each ferrite. A reference plot was collected.

The AUT was then put into the chamber in place of the reference antenna. The AUT was connected to the signal generator using the RF same cable and connector setup. A polar plot was then collected at the antenna height of maximum field strength. This plot was then compared to the reference antenna scan, and, using the antenna gain (dBi) of the reference antenna the absolute gain of the AUT was calculated.
