

antenna cable 5m for ARE K1 PFB or IBS

The antenna is connected with the decoder ant by the antenna-cable. Very low signals are conducted in the cable. Special attention should be paid at the cable routing that unnecessary external signals are not conducted. That is why the antenna-cable should be laid separately, particularly not in cable tunnels. Optimal reading performance is achieved using the original AEG ID antenna-cable. This antenna-cable is delivered pre-manufactured at the side of the antenna and fits to the reading system regarding shielding and cable capacity. The standard cable length is 5 m. The cable may not be shortened! Special cables with length of 1m to 10m are available on enquiry.
