7. RF EXPOSURE

Maximum field strength level at 3 meters is 90.90dB $\mu\text{V}/\text{m}$

Based on formula $E(\text{dB}\mu\text{V}/\text{m}) = P(\text{dBm EIRP}) + 95.2$ to onvert a peak field strength level at 3 meters

EIRP = -4.30dBm (0.371 mW) at 912MHz

In accordance with KDB 447498 D01 General RF Exposure Guidance v06:

$\text{PSD} = \text{EIRP}/(4*\pi*R^2) = 0.371/(4*\pi*(20 \text{ cm})^2) = 0.000074 \text{ mW}/\text{cm}^2$

Limit= 1 mW/cm²

In accordance with RSS-102, Issue 5, Section 2.5.2., as EIRP is lower than 1.38W at 912 MHz, routine evaluation exemption of RF exposure for ISED can be considered for a distance > 20cm.

8. TEST CONDITIONS AND RESULTS

8.1. Radiated emission limits

Reference standard:	FCC part 15 Radio part 15.249 and RSS-210
Test method:	ANSI C63.4 : 2014 ANSI C63.10 : 2013
Test description for measurement below 30MHz : Spurious domain emission limits are limits on emissions at frequencies other than those of the carrier and sidebands associated with normal test modulation. EUT is set on an insulating support at 80cm above the ground reference plane. Preliminary (peak) measurements were performed at an antenna to EUT separation distance of 3-meter in a anechoic chamber. The EUT was rotated 360° in order to maximize radiated levels. Test antenna was oriented in 3 axes (0°, 45° and 90°). Final measurements (quasi-peak) were then performed in a 10-meter Open Area Test Site that complies to CISPR 16 in the same measurement conditions. All frequencies were investigated, where applicable. Test description for measurement above 30MHz : EUT is set on an insulating support at 80(f<1GHz), 150cm(f>1GHz)cm above the ground reference plane. Preliminary (peak) measurements were performed at an antenna to EUT separation distance of 3-meter. The EUT was rotated 360° about its azimuth with the receive antenna located at various heights in horizontal and vertical polarities. Final measurements (quasi-peak or average) were then performed in a semi-anechoic chamber or Open Area Test Site that complies to CISPR 16. The EUT was rotated 360° about its azimuth and adjusting the receive antenna height from 1 to 4 m. All frequencies were investigated, where applicable. For portable equipments a research of maximum level is done on the 3 axes. Only the highest levels are recorded.

8.2. Band-edge compliance

Reference standard:	FCC part 15 Radio part 15.249 and RSS-210
Test method:	FCC part 15.249 subclause d) and RSS-210
Test description: d) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209, whichever is the lesser attenuation. EUT is set on an insulating support at 80cm above the ground reference plane (150cm for $f > 1\text{GHz}$). Masurements were performed in a semi-anechoic chamber or Open Area Test Site that complies to CISPR 16. The EUT was rotated 360° about its azimuth and adjusting the receive antenna height from 1 to 4 m. For portable equipments a research of maximum level is done on the 3 axes. 8.3. Field strength of fundamental

Reference standard:	FCC part 15 Radio part 15.249 and RSS-210
Test method:	FCC part 15.249, RSS-210
General test setup: EUT is set on an insulating support at 80cm above the ground reference plane. Measurements were performed at an antenna to EUT separation distance of 3-meter. The EUT was rotated 360° about its azimuth with the receive antenna located at various heights (1m to 4m) in horizontal and vertical polarities. For portable equipments a research of maximum level is done on the 3 axes. Only the highest levels are recorded.

8.4. Occupied Bandwidth

Reference standard:	FCC part 15 Radio part 15.215 c)
Test method:	FCC part 15 Radio part 15.215 c) and RSS Gen
Test description: The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage. If frequency stability is not specified in the regulations, it is recommended that the fundamental emission be kept within at least the central 80% of the permitted band in order to minimize the possibility of out-of-band operation. EUT is connected to the measuring receiver via 50Ω attenuator(s).
