Transmitter Radiated Spurious Emissions

During radiated emission testing all antenna ports of the base station were terminated with 50ohm termination blocks as shown in the diagram below.

Based on antenna port conducted spurious emissions tests results, preliminary scans for radiated spurious emissions were performed in 30MHz – 9GHz frequency range.

Two radiated emission test configurations (with the RRH fan assembly) are needed to prove compliance for the 3GPP Band 5 transmitters. The first test is with the 3GPP Band 5 carriers operating at 40W/carrier (3GPP Band 13 carriers are not enabled). The second test is with the 3GPP Band 5 and the 3GPP Band 13 carriers enabled simultaneously (20 watts per carrier and 40 watts per port) on all four ports.

The bottom, middle and top frequency channels for each band were enabled. The AHBCA band 13 configured for LTE10 may operate only on the middle channel since the operational bandwidth is 10MHz wide (The band 13 carrier covers the entire downlink band). The carrier configurations for the radiated emission testing are provided below. Final maximized radiated emissions were measured in these modes.

Frequency Band	Antenna Port	RF Bandwidth	EARFCN	Transmit Frequency	Carrier Power

A three-meter measurement distance was used for radiated emission measurements. The highest radiated emissions detected were more than 20dB below the three-meter limit of 82.2dBuV/m (equivalent to -13dBm EIRP). Since all maximized measurements were more than 20dB below these levels, substitution measurements were not performed. TILE software was used for all preliminary scans and plots that are included on the following pages.

Frequency Stability/Accuracy

Carrier frequency stability of the EUT at extreme temperatures and voltages was measured. The frequency error was measured as follows:

- (1) EUT transmitting in 5MHz-QPSK-LTE mode at center channel (881.5MHz) on port 2.
- (2) The EUT temperature was stabilized at each temperature step (for a minimum of 30 minutes) prior to frequency accuracy measurement.

Nominal operating voltage of the product is declared as 48VDC. Frequency error results are listed below for extreme voltages and temperatures.

Extreme Voltages:

Percentage of Rated Supply	DC Voltage (VDC)	Maximum Frequency Error (Hz) at 20°C
85%	40.8	0.84
100%	48.0	0.98
115%	55.2	0.94

Extreme Temperatures:

Temperature	Maximum Frequency Error (Hz) at 48VDC
-30 °C	2.80
-20 °C	1.10
-10 °C	1.07
0 °C	0.88
10 °C	0.76
20 °C	0.98
30 °C	1.14
40 °C	1.21
50 °C	1.01

The highest recorded frequency error is 2.80 Hz or ~0.003 ppm. The deviation limit is defined as ± 1.5 ppm in section FCC 22.355 and RSS 132 5.3. The allowable deviation is ± 1322.3 Hz at the center channel (EARFCN 2525: 881.5 MHz).

The results above are deemed sufficient to demonstrate carrier frequency stability for all other channel bandwidth modes and modulations since all carriers are controlled by the same frequency stabilization circuitry that was subjected to the extreme conditions under this test.

APPENDIX B: ANTENNA PORT TEST DATA FOR BAND 13 (746-756MHZ)

All conducted RF measurements for this test effort in this section were made at AHBCA antenna ports for Band 13 measurements. The test setup used is provided below.

RF Output Power

RF output power has been measured in both Peak and RMS Average terms for each Band 13 transmit chain at the middle channel for 256QAM modulation and LTE5 bandwidth. Peak to average power ratio (PAPR) has been calculated as described in Section 5.7.2 of KDB971168 D01 v02r02 and all results are presented in tabular form below.

Antenna	LTE Bandwidth	LTE - 256QAM		
		Peak (dBm)	Average (dBm)	PAPR (dB)
Port 1 Middle Channel	5M	53.83	46.04	7.79
Port 2 Middle Channel	5M	53.95	46.14	7.81
Port 3 Middle Channel	5M	53.77	46.00	7.77
Port 4 Middle Channel	5M	53.80	45.99	7.81

The variation in RMS output power levels between the antenna ports is 0.15 dB per data sample provided above. Pre-compliance testing (and testing of similar EUTs) shows that the output power variation between antenna ports is small (the output ports are essentially electrically identical).

Pre-compliance testing has shown that the output power variation between modulation types is small. Antenna port 2 power output measurements for the LTE5 bandwidth for all modulation types on the middle (center) channel are provided below.

	Modulation Type							
	QPSK		16QAM		64QAM		256QAM	
	Peak (dBm)	Ave (dBm)	Peak (dBm)	Ave (dBm)	Peak (dBm)	Ave (dBm)	Peak (dBm)	Ave (dBm)
Antenna Port 2 Middle Channel LTE5	53.98	46.14	53.90	46.17	53.95	46.14	53.95	46.14

The output power variation between modulation types is small in this measurement snapshot (and from past efforts on similar hardware as well). The variation of average power output versus modulation type is 0.03dB for the data snapshot provided. The variation of peak power output versus modulation type is 0.08dB for the data snapshot provided. All power measurements in this report (except the sample test noted above) were performed with the EUT operating with 256QAM modulation.
