

EMC TEST REPORT

Report Number: 102734003LAX-001

Project Number: G102734003

Report Issue Date: September 30, 2016

Model(s) Tested: NGP680137

Standards: **FCC CFR47 Part 15 Subpart C, 2016**

Intentional Radiator

§15.247, Operation within the bands 902-928 MHz, 2400-2483.5 MHz,
and 5725-5850 MHz

ISED RSS-247 Issue 1, May 2015

Digital Transmission Systems (DTSS), Frequency Hopping Systems (FHS)
and Licence-Exempt Local Area Network (LE-LAN) Devices

Tested by:

Intertek

25791 Commercentre Drive
Lake Forest, CA 92630
USA

Client:

Abbott Medical Optics Inc.
1700 E Saint Andrew Place
Santa Ana, CA 92705
USA

Report prepared by

Grace Lin
EMC Staff Engineer

Report reviewed by

Bryan Taylor
EMC Team Leader

This report is for the exclusive use of Intertek's Client and is provided pursuant to the agreement between Intertek and its Client. Intertek's responsibility and liability are limited to the terms and conditions of the agreement. Intertek assumes no liability to any party, other than to the Client in accordance with the agreement, for any loss, expense or damage occasioned by the use of this report. Only the Client is authorized to permit copying or distribution of this report and then only in its entirety. Any use of the Intertek name or one of its marks for the sale or advertisement of the tested material, product or service must first be approved in writing by Intertek. The observations and test results in this report are relevant only to the sample tested. This report by itself does not imply that the material, product, or service is or has ever been under an Intertek certification program.

1 Introduction and Conclusion

The tests indicated in section 2.0 were performed on the product constructed as described in section 4.0. The remaining test sections are the verbatim text from the actual data sheets used during the investigation. These test sections include the test name, the specified test Method, a list of the actual Test Equipment Used, documentation Photos, Results and raw Data. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted.

Based on the results of our investigation, we have concluded the product tested comply with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested. Intertek does not make any claims of compliance for samples or variants which were not tested.

2 Test Summary

Test	Rule Section		Results
	US FCC	Canada ISSED	
Carrier Frequency Separation	§15.247(a)(1)	§5.1 2 of RSS-247	Complies
Number of Hopping Frequencies	§15.247(a)(1)	§5.1 4 of RSS-247	Complies
Time of Occupancy (Dwell Time)	§15.247(a)(1)	§5.1 4 of RSS-247	Complies
20 dB Bandwidth	§15.247(a)(1)	§5.1 1 of RSS-247	Complies
99% Occupied Bandwidth	-	§4.6.1 of RSS-Gen	(for reporting purpose)
Peak Output Power, conducted	§15.247(b)(1)	§5.4 2 of RSS-247	Complies
Band-edge	§15.247(d)	§5.5 of RSS-247	Complies
Conducted Spurious Emissions	§15.247(d)	§5.5 of RSS-247	Complies
Radiated Spurious Emissions	§15.247(d)	§8.9 of RSS-Gen	Complies
AC Power Line Conducted Emissions	§15.207	§8.8 of RSS-Gen	Complies

3 Client Information

4 Description of Equipment Under Test and Variant Models

Equipment Under Test			
Description	Manufacturer	Model Number	Serial Number
Remote Control	Abbott Medical Optics Inc.	NGP680137	009

Receive Date:	9/21/2016
Received Condition:	Good
Type:	Production

Dates of Tests:	09/22/2016 – 09/25/2016, 09/30/2016
-----------------	-------------------------------------

Description of Equipment Under Test

The equipment under test (EUT) is a device with one Bluetooth transceivers operating in the 2.4 GHz frequency band.

The WHITESTAR Signature Pro Remote Control system consists of the Remote Control Master and Remote Control Slave, the master resides in the WHITESTAR Signature Pro Console NGP680301 and the slave resides in the Remote Control NGP680137. Each device: Master and Slave consists one National Semiconductor's LMX98XX series Bluetooth radios ICs (transceivers), operating in the 2.4 GHz frequency band. This radio subsystem is used to communicate the monitor control signal to the WHITESTAR Signature Pro System for use in cataract surgery.

Equipment Under Test Power Configuration			
Rated Voltage	Rated Current	Rated Frequency	Number of Phases
4.8 Vdc	100 mA	N/A	N/A
100-240 Vac (AC Adapter)	0.8 – 0.4 A	47 – 63 Hz	1

Operating modes of the EUT:

No.	Descriptions of EUT Exercising
1	Test Mode – Continuously Transmit
2	Test Mode - Hopping Enabled
3	Charging Mode

Software used by the EUT:

No.	Descriptions of EUT Exercising
1	Under test mode, the EUT was programmed to transmit continuously during testing. The EUT was powered by new fully charged batteries during measurement.
2	Under charging mode (for AC power line conducted emission measurement), the EUT did not transmit.

Radio/Receiver Characteristics	
Frequency Range	2402-2480 MHz
Type of Transmission	Frequency Hopping Spread Spectrum
Number of Channel(s)	79
Modulation Type(s)	GFSK
Data Rate	1 Mbps
Maximum Output Power	-3.84 dBm (0.413 mW)
Test Channels	2402 MHz, 2441 MHz, 2480 MHz
Equipment Type	Standalone
Antenna Type and Gain	On-board antenna, 2.5 dBi

5 System Setup and Method

Cables

Charging Mode:

6 Carrier Frequency Separation

6.1 Requirement(s)

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

6.2 Method

The procedure described in Section 7.8.2 of ANSI C63.10-2013 was used.

TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA. IC test site registration number is 2042T.

6.3 Test Equipment Used:

Asset	Description	Manufacturer	Model	Serial	Cal Date	Cal Due
637	3m Semi-anechoic Chamber	Panashield	3 meter	25 331-D-Z	August 2015	August 2018
1140	EMI Test Receiver	Rohde & Schwarz	ESCI7	100825	02/22/2016	02/22/2017

Input Voltage: 4.8 Vdc (nominal battery voltage)
Pretest Verification w/ BB Source: N/A

Test Date: 09/23/2016
Limit Applied: FCC 15.247, IC RSS-247
Ambient Temperature: 21.6 °C
Relative Humidity: 51.7 %
Atmospheric Pressure: 990.8 mbars

Deviations, Additions, or Exclusions: None

Date: 23.SEP.2016 17:16:13

7 Number of Hopping Frequencies

7.1 Requirement(s)

Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used

7.2 Method

The procedure described in Section 7.8.3 of ANSI C63.10-2013 was used.

TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA. IC test site registration number is 2042T.

7.3 Test Equipment Used:

Asset	Description	Manufacturer	Model	Serial	Cal Date	Cal Due
637	3m Semi-anechoic Chamber	Panashield	3 meter	25 331-D-Z	August 2015	August 2018
1140	EMI Test Receiver	Rohde & Schwarz	ESCI7	100825	02/22/2016	02/22/2017
1001	Barometer/Humidity	Omega	iBTHX-W	0440775	04/22/2016	04/22/2017

Software Utilized:

Name	Manufacturer	Version	Profile
N/A	N/A	N/A	N/A

7.4 Results:

The sample tested was found to comply. The EUT has 79 hopping channels.

7.6 Plots/Data:

Test Personnel:	Grace Lin
Product Standard:	FCC 15.247, IC RSS-247
Input Voltage:	4.8 Vdc (nominal battery voltage)
Pretest Verification w/ BB Source:	N/A

Test Date:	09/23/2016
Limit Applied:	FCC 15.247, IC RSS-247
Ambient Temperature:	21.6 °C
Relative Humidity:	51.7 %
Atmospheric Pressure:	990.8 mbars

Deviations, Additions, or Exclusions: None

Date: 23.SEP.2016 17:23:53

Number of Hopping Channels: 79

8 Time of Occupancy (dwell time)

8.1 Requirement(s)

For frequency hopping systems operating in the 2400-2483.5 MHz band, the average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

8.2 Method

The procedure described in Section 7.8.4 of ANSI C63.10-2013 was used.

Since the radio is employed 79 hopping channels, the Occupancy Time was calculated for the period of $0.4 * 79 = 31.6$ sec.

TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA. IC test site registration number is 2042T.

8.3 Test Equipment Used:

9 20 dB Bandwidth

9.1 Requirement(s)

The 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated

9.2 Method

The procedure described in Section 6.9.2 of ANSI C63.10-2013 was used.

TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA. IC test site registration number is 2042T.

9.3 Test Equipment Used:

11 Maximum Peak Conducted Output Power at Antenna Terminals

11.1 Requirement(s)

For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, the maximum peak output power is 1 watt (30 dBm). For all other frequency hopping systems operating in the 2400-2483.5 MHz band, the maximum peak output power is 0.125 watts.

11.2 Method

The procedure described in Section 7.8.5 of ANSI C63.10-2013 was used.

TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA. IC test site registration number is 2042T.

14 Radiated Spurious Emissions

14.1 Requirement(s)

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

In any 100 kHz bandwidth outside the EUT pass-band, the RF power shall be below the maximum in-band 100 kHz emissions by at least 20 dB (if peak power of in-band emission is measured) or 30 dB (if average power of in-band emission is measured).

The field strength of emissions from intentional radiators operated within the frequency band shall comply with the following:

14.2 Method

EUT was configured to transmit continuously. Radiated emission measurements were performed from 30 MHz to 25 GHz according to the procedure described in ANSI C64.10. Spectrum analyzer resolution bandwidth is 120 kHz for frequencies 30 MHz to 1000 MHz. Above 1 GHz, both Peak and Average measurements were performed. The peak level of radiated emissions was measured with a resolution bandwidth (RBW) of 1 MHz and a video bandwidth (VBW) of 3 MHz. The average level of radiated emissions was measured with a resolution bandwidth (RBW) of 1 MHz and a video bandwidth (VBW) of 10 Hz.

The EUT is placed on a plastic turntable that is 80 cm in height for frequencies 30 MHz to 1000 MHz, 1.5 meters for frequency above 1000 MHz. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). During testing, all cables were manipulated to produce worst-case emissions. The signal is maximized through rotation. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters.

Radiated emissions are taken at 3 meters for frequencies below 18 GHz and 1 meter for frequencies above 18 GHz. Radiated emissions were investigated in three orthogonal axes. Data included is representative of the worst-case configuration (the configuration which resulted in the highest emission levels).

New fully charged batteries were used.

TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA. IC test site registration number is 2042T.

Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	U _{CISPR}
Radiated Emissions, 3m	30-1000 MHz	4.3	6.3 dB
Radiated Emissions, 3m	1-18 GHz	5.5	5.2 dB
Radiated Emissions, 1m	18-26.5 GHz	4.5	-

As shown in the table above our radiated emissions U_{lab} is less than the corresponding U_{CISPR} reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

Sample Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

Where

- FS = Field Strength in dB μ V/m
- RA = Receiver Amplitude (including preamplifier) in dB μ V
- CF = Cable Attenuation Factor in dB
- AF = Antenna Factor in dB
- AG = Amplifier Gain in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB μ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB μ V/m. This value in dB μ V/m was converted to its corresponding level in μ V/m.

RA = 52.0 dB μ V
AF = 7.4 dB/m
CF = 1.6 dB
AG = 29.0 dB
FS = 32 dB μ V/m

To convert from dB μ V to μ V or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where } UF = \text{Net Reading in } \mu\text{V}$$

NF = Net Reading in dB μ V

Example:

$$FS = RA + AF + CF - AG = 52.0 + 7.4 + 1.6 - 29.0 = 32.0$$
$$UF = 10^{(32 \text{ dB}\mu\text{V} / 20)} = 39.8 \mu\text{V/m}$$

14.4 Results:

The data on the following pages list the significant emission frequencies, the limit and the margin of compliance.

Radiated emission measurements were performed up to 25GHz. Peak emissions that were identified were measured to be greater than 20dB below 74dB μ V peak limits. No Emissions were identified when scanned from 18-25 GHz.

15 AC Power Line Conducted Emissions

15.1 Performance Criterion

Frequency Band MHz	FCC 15.207 Limit dB(μV)	
	Quasi-Peak	Average
0.15-0.50	66 to 56 *	56 to 46 *
0.50-5.00	56	46
5.00-30.00	60	50

*Note: *Decreases linearly with the logarithm of the frequency
At the transition frequency the lower limit applies.*

15.2 Method

Measurements are carried out using quasi-peak and average detector receivers in accordance with CISPR 16. An AMN is required to provide a defined impedance at high frequencies across the power feed at the point of measurement of terminal voltage and also to provide isolation of the circuit under test from the ambient noise on the power lines. An AMN as defined in CISPR 16 shall be used.

The EUT is located so that the distance between the boundary of the EUT and the closest surface of the AMN is 0.8m.

Where a flexible mains cord is provided by the manufacturer, this shall be 1m long or if in excess of 1m, the excess cable is folded back and forth as far as possible so as to form a bundle not exceeding 0.4m in length.

The EUT is arranged and connected with cables terminated in accordance with the product specification.

Conducted disturbance is measured between the phase lead and the reference ground, and between the neutral lead and the reference ground. Both measured values are reported.

The EUT, where intended for tabletop use, is placed on a table whose top is 0.8m above the ground plane. A vertical, metal reference plane is placed 0.4m from the EUT. The vertical metal reference-plane is at least 2m by 2m. The EUT shall be kept at least 0.8m from any other metal surface or other ground plane not being part of the EUT. The table is constructed of non-conductive materials. Its dimensions are 1m by 1.5m, but may be extended for larger EUT.

Floor standing EUT are placed on a horizontal metal ground plane and isolated from the ground plane by resting on an insulating material. The metal ground plane extends at least 0.5m beyond the boundaries of the EUT and has minimum dimensions of 2m by 2m.

Equipment setup for conducted disturbance tests followed the guidelines of ANSI C63.4.

TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA. IC test site registration number is 2042T.

Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	Ucisp
AC Line Conducted Emissions	150 kHz - 30 MHz	2.1 dB	3.4dB
Telco Port Emissions	150 kHz - 30 MHz	2.6 dB	5.0dB

As shown in the table above our conducted emissions U_{lab} is less than the corresponding U_{CISPR} reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

Sample Calculations

The following is how net line-conducted readings were determined:

$$NF = RF + LF + CF + AF$$

Where NF = Net Reading in dB μ V

RF = Reading from receiver in dB μ V

LF = LISN or ISN Correction Factor in dB

CF = Cable Correction Factor in dB

AF = Attenuator Loss Factor in dB

To convert from dB μ V to μ V or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where } UF = \text{Net Reading in } \mu\text{V}$$

$$NF = \text{Net Reading in dB}\mu\text{V}$$

Example:

$$NF = RF + LF + CF + AF = 28.5 + 0.2 + 0.4 + 20.0 = 49.1 \text{ dB}\mu\text{V}$$

$$UF = 10^{(49.1 \text{ dB}\mu\text{V} / 20)} = 285.1 \mu\text{V/m}$$
