1.3 PRODUCT INFORMATION

1.3.1 Technical Description

The Equipment Under Test (EUT) was a Safran Electronics & Defense ULTIMA-DT-07 Beacon as shown in the photograph below. A full technical description can be found in the manufacturer's documentation.

Figure 1 - Equipment Under Test

1.3.2 Physical Test Configuration

The Equipment Under Test (EUT) was operated using its own power source (internal battery). No other power source is required to operate the EUT. For conducted tests, the EUT was configured so that the antenna port was connected to the 50 Ω test system using a coaxial cable. For radiated tests, the EUT was fitted with its proper antenna via a 3-meter coaxial cable.

To ensure ancillaries were active during tests, external navigation data was provided via the ARINC interface. However, no live navigation data was provided. Photographs below:

Figure 2 – Test Configuration

System Configurations

Figure 3 - Conducted Laboratory Tests

Battery Current Measurements

Note: The resistor in series with negative line of battery

* Removed for Standby mode measurements

For other Navigation, Satellite and Antenna test configurations, see photographs in section 4 of this report.

Further Information

All tests were carried out with all ancillaries connected and by activating the EUT via the EUT's Switch unless otherwise stated.

At the beginning of each test, the EUT is in armed mode for 100 seconds and measurements commence immediately after the EUT is activated.

Power Alignment

Only one conducted test sample was submitted by the manufacturer, therefore the power alignment measurement is not applicable.

1.3.3 Modes of Operation

Modes of operation of the EUT during testing were as follows:

Activation by Crash Sensor

- Activation by triggering the crash sensor.
- Homing signal active.
- External Navigation Input active
- GNSS receiver active

Operating (Active)

- Remote switch to “ON” position
- External Navigation Input active
- GNSS receiver active

1.4 TEST LOCATIONS

All tests: Octagon House Laboratory, Fareham, Hampshire, UK

1.5 MODIFICATIONS

Modification 0 - No modifications were made to the test sample during testing.

Note: some tests took place over one or more days and consequently it may appear that some of the test equipment could have been outside of the valid calibration period at the time of testing. However, we confirm that all equipment held a valid and in-date calibration when used, and we hold this information on record.

Annex A – Battery Current Comparison

Presented in the table below is the battery current comparison between the DT-06 and DT-07 variants. The operating mode used was 'On at Crash Sensor, with no external navigation data applied'. Please see comments below:

Operating Mode	DT-06	DT-07	% Difference
	Average Current (mA)	Average Current (mA)	DT-06 to DT-07
On at Crash Sensor with no external navigation data applied.	113.68	113.12	-0.49

Comments:

Current measurement test has been performed on the DT-06 beacon which was then upgraded to DT-07 with a software update.

Current measurement was therefore performed on the same beacon, showing that the software update from DT-06 to DT-07 has no influence on the current drawn by the beacon.

Current measurement test was performed in the worst-case current consumption mode.
