6.2 Max. Conducted peak output power

6.2.1 Standard Applicable [FCC §15.247(b)(1)]

For systems using digital modulation in the 2400 MHz ~ 2 483.5 MHz bands : 1 Watt.

As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power.

6.2.2 Test Environment conditions

- Ambient temperature : 22 °C,
- Relative Humidity : (54 ~ 55) % R.H.

The maximum peak conducted output power can be measured using a broadband peak RF power meter. The power meter must have a video bandwidth that is greater than or equal to the DTS bandwidth and shall utilize a fast, average-responding diode type sensor.

6.2.3 Measurement Procedure

- ① Reference frequency generated from the signal generator is supply to power meter input port via RF cable and attenuator, and then, it's apply to offset value on power meter as follows ;
- ② Remove the antenna from the EUT and then connected to power meter via a suitable low loss RF cable and attenuator.
- ③ Place the EUT on the table and set it function disable at the lowest, middle and the highest available channels.
- ④ Power meter was used to directly measure the output power from RF output port on the EUT in continuously transmitting modulation
- ⑤ The indicated level is the peak output power.
- ⑥ Please refer to the detailed procedure method FCC Public Notice(KDB 558074 D01)

6.2.4 Test Setup Configuration

6.3.2 Test Environment conditions

- Ambient temperature : 22 °C,
- Relative Humidity : (54 ~ 55) % R.H.

6.3.3 Measurement Procedure

The power spectral density conducted from the intentional radiator was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its function disable at the highest, middle and the lowest available channels. This procedure must be used if maximum peak conducted output power was used to demonstrate compliance to the fundamental output power limit, and is optional if the maximum conducted output power was used to demonstrate compliance.

- RBW : ≥ 3 kHz
- VBW : $\geq 3 \times$ RBW
- Sweep : auto
- Detector function : peak
- Trace : max hold

6.7.2 Test Environment conditions

- Ambient temperature : 21 °C,
- Relative Humidity : (54 ~ 55) % R.H.

6.7.3 Measurement Procedure

The measurements procedure of the transmitter radiated E-field is as following describe method.

A pre-scan is performed in a Shield chamber to determine the accurate frequencies before final test, after maximum emissions level will be checked on a open test site and measuring distance is 3 m from EUT to test antenna.(O.A.T.S is ensured that comply with at least 6 dB above the ambient noise level)

- ① The EUT was powered ON with normal operating mode and placed on a 0.8 meter high non-conductive table on the reference ground plane. If EUT is connected to cables, that were fixed to cause maximum emission.
 - ② For above 1 GHz, the test antenna is used on Horn antenna, and if the below 1 GHz, loop and broad- band antenna were used. It made with the antenna positioned in both the horizontal and vertical plane of polarization.
 - ③ The output of the test antenna will be connected to a measuring receiver, and it is set to tuned over the frequency range according to required standard
 - ④ For emission frequencies measured below 1 GHz, The measuring bandwidth and detector type of the measurement receiver is set on using measurement instrumentation employing a CISPR Quasi Peak detector, and for above 1GHz, set the spectrum analyzer on a 1 MHz resolution bandwidth with average and peak detector for each frequency.
 - ⑤ The frequencies at which a relevant radiated signal component is detected, the test antenna will be raised and lowered through the specified heights range(from 1 to 4 meters) in horizontal polarized orientation, until an maximum signal level is detected on the measuring receiver(or spectrum analyzer).
 - ⑥ Repeat step ⑤ with antennal in vertical polarized orientations.
 - ⑦ The transmitter is position x, y, z axis on turn table rotating through 360 degrees, until the maximum signal level is detected by the measuring receiver.
 - ⑧ The receiver is scanned from requested measuring frequency band and then the maximum meter reading is recorded. The radiated emissions were record the test result.
- The measurement results are obtained as described below:
$$\text{Result(dB/}\mu\text{A/m)} = \text{Reading(dB/}\mu\text{A)} + \text{Antenna factor(dB/m)} + \text{CL(dB)} + \text{other applicable factor (dB)}$$

※ if necessary, additionally receiver is adopted high-pass filter and preamp because lower radiated signal

6.8 Antenna requirement

6.8.1 Standard applicable [FCC §15.203, §15.247(4)(1)]

For intentional device, according to §15.203, an intentional radiator shall be designed to ensure that no antenna other than furnished by responsible party shall be used with the device.

The use of a permanently attached antenna or of an antenna that user a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.

The manufacturer may design the unit So that broken antenna can be replaced by the user, but the Use of a standard antenna jack or electrical connector is prohibited.

And according to §15.247(4)(1), the conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6dBi.

According to above requirement standard's This product's antenna type is an Omni directional type and it's gain is 2 dBi, So radiated emission field strength from EUT is below requirement standard limit

6.8.2 Antenna gain

Frequency Range	Gain [dBi]	Limit [dBi]	Results
2400 MHz ~ 2483.5 MHz	0.5	≤ 6	Pass

6.9 AC Power Conducted emissions

6.9.1 Standard Applicable [FCC §15.207(a)]

For intentional radiator that is designed to be connected to the public utility(AC)power line, the radio frequency Voltage that is conducted back onto the AC power line on any frequencies hopping mode within the band 150kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50uH/50 ohms line Impedance stabilization network(LISN). Compliance with the provisions of this paragraph shall be based on The measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

§15.207 limits for AC line conducted emissions;

Frequency of Emission(MHz)	Conducted Limit (dB μ V)	
	Quasi-peak	Average
0.15 ~ 0.5	66 to 56 *	56 to 46 *
0.5 ~ 5	56	46
5 ~ 30	60	50

* Decreases with the logarithm of the frequency

6.9.4 E.U.T Test Configuration

6.9.5 Measurement Procedure

EUT was placed on a non-metallic table height of 0.8 m above the reference ground plane.

Cables connected to EUT were fixed to cause maximum emission.

Test was made with the antenna positioned in both the horizontal and vertical planes of polarization.

The measurement antenna was varied in height above the conducting ground plane to obtain the Maximum signal strength.

6.9.6 Test environment conditions

- Normal temperature : 22 °C
- Relative humidity : (44 ~ 45) % R.H.
- Pressure : 98 k Pa
