1.7. SAR Test Exclusion

☒ SAR test exclusion is applied according to KDB 447498 D01.

The 1-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

$$[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot$$

$$[\sqrt{f(\text{GHz})}] \leq 3.0 \text{ for 1-g SAR and } \leq 7.5 \text{ for 10-g extremity SAR, where:}$$

- * $f(\text{GHz})$ is the RF channel transmit frequency in GHz
- * Power and distance are rounded to the nearest mW and mm before calculation
- * The result is rounded to one decimal place for comparison
- * When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion

Body-Worn SAR (1-g SAR) Test Exclusion as per KDB 447498 D01

3. Conducted Power Measurements

☒ <The Initial Test Configuration Procedures for Wi-Fi>

According to KDB 248227 D01,

the initial test configuration is determined by the 802.11 configuration with the highest maximum output power specified for production units, including tune-up tolerance, in each standalone and aggregated frequency band.

When multiple channel bandwidth configurations in a frequency band have the same specified maximum output power, the initial test configuration is determined by applying the following steps sequentially.

- 1) The largest channel bandwidth configuration is selected among the multiple configurations in a frequency band with the same specified maximum output power.
- 2) If multiple configurations have the same specified maximum output power and largest channel bandwidth, the lowest order modulation among the largest channel bandwidth configurations is selected.
- 3) If multiple configurations have the same specified maximum output power, largest channel bandwidth and lowest order modulation, the lowest data rate configuration among these configurations is selected.
- 4) When multiple transmission modes (802.11a/g/n/ac) have the same specified maximum output power, largest channel bandwidth, lowest order modulation and lowest data rate, the lowest order 802.11 mode is selected; i.e., 802.11a is chosen over 802.11n then 802.11ac or 802.11g is chosen over 802.11n.

4. SAR Measurements

☒ <SAR Correction/Scaling>

According to KDB 447498 D01, KDB 248227 D01, and/or KDB 865664 D01, the maximum SAR values are determined by taking account of the following correction or scaling factors.

The maximum 1-g SAR and/or 10-g SAR values (reported SAR) are calculated by applying the Δ SAR positive correction for deviations of the tissue-equivalent liquid and the power scaling for the maximum duty factor and maximum possible power levels (maximum tune-up tolerance limit) to each measured 1-g SAR and/or 10-g SAR value:

$$\begin{aligned} \text{Reported SAR (W/kg)} &= \text{Measured SAR (W/kg)} * \Delta\text{SAR positive correction factor} \\ &\quad * \text{Duty cycle scaling factor} * \text{Tune-up scaling factor} \end{aligned}$$

where;

$$\Delta\text{SAR positive correction factor} = (100 - \Delta\text{SAR}^{*1}) / 100$$

$$\text{Duty cycle scaling factor} = \text{Max. possible duty cycle} / \text{Measured duty cycle used for the SAR measurement}$$

$$\text{Tune-up scaling factor} = \text{Max. possible power (mW)} / \text{Measured power used for the SAR measurement (mW)}$$

$$*1 \quad \Delta\text{SAR} (\%) = c_e * \Delta\epsilon_r + c_o * \Delta\sigma$$

<For 1-g SAR>

$$c_e = -7.854 * 10^{-4} f^3 + 9.402 * 10^{-3} f^2 - 2.742 * 10^{-2} f - 0.2026$$

$$c_o = 9.804 * 10^{-3} f^3 - 8.661 * 10^{-2} f^2 + 2.981 * 10^{-2} f + 0.7829$$

<For 10-g SAR>

$$c_e = 3.456 * 10^{-3} f^3 - 3.531 * 10^{-2} f^2 + 7.675 * 10^{-2} f - 0.1860$$

$$c_o = 4.479 * 10^{-3} f^3 - 1.586 * 10^{-2} f^2 - 0.1972 f + 0.7717$$

where;

c_e coefficient representing the sensitivity of SAR to permittivity

$\Delta\epsilon_r$ percent change in permittivity

c_o coefficient representing the sensitivity of SAR to conductivity

$\Delta\sigma$ percent change in conductivity

f frequency in GHz

A negative Δ SAR would translate to a lower measured SAR value than what would be measured if using dielectric properties equal to the target values.

A positive Δ SAR would translate to a higher measured SAR value than what would be measured if using dielectric properties equal to the target values.

SAR correction shall not be made when the Δ SAR has a positive sign to provide a conservative SAR value.

The SAR is only corrected when Δ SAR has a negative sign.

☒ <SAR Test Reduction for Wi-Fi>

SAR test reduction for Wi-Fi is applied according to KDB 248227 D01.

For 2.4 GHz 802.11g/n OFDM configurations

SAR is not required for the following 2.4 GHz OFDM conditions.

- 1) When KDB Publication 447498 SAR test exclusion applies to the OFDM configuration.
- 2) When the highest reported SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is ≤ 1.2 W/kg or 3 W/kg (1-g or 10-g respectively).

For U-NII-1 (5.2 GHz) and U-NII-2A (5.3 GHz) Bands

When the same transmitter and antenna(s) are used for U-NII-1 and U-NII-2A bands, additional SAR test reduction applies.

- 1) When the same maximum output power is specified for both bands, begin SAR measurement in U-NII-2A band by applying the OFDM SAR requirements. If the highest reported SAR for a test configuration is ≤ 1.2 W/kg or 3 W/kg (1-g or 10-g respectively), SAR is not required for U-NII-1 band for that configuration (802.11 mode and exposure condition); otherwise, each band is tested independently for SAR.
- 2) When different maximum output power is specified for the bands, begin SAR measurement in the band with higher specified maximum output power. The highest reported SAR for the tested configuration is adjusted by the ratio of lower to higher specified maximum output power for the two bands. When the adjusted SAR is ≤ 1.2 W/kg or 3 W/kg (1-g or 10-g respectively), SAR is not required for the band with lower maximum output power in that test configuration; otherwise, each band is tested independently for SAR.

5. Simultaneous Transmission SAR evaluation

☒ <SAR Summation Analysis>

Simultaneous transmission SAR evaluation is determined according to KDB 447498 D01, Evaluation by summation of Reported SAR values, as the reference method.

- 1) If Reported SAR summation $> 1.6\text{W/kg}$, SAR test exclusion is determined by the SPLSR.
- 2) $\text{SPLSR} = (\text{SAR}_1 + \text{SAR}_2)^{1.5} / (\text{minimum separation distance})$, and the peak separation distance is determined from the square root of $[(x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2]$ where (x_1, y_1, z_1) and (x_2, y_2, z_2) are the coordinates of the extrapolated peak SAR location in the zoom scan.
- 3) If $\text{SPLSR} \leq 0.04$, simultaneously transmission SAR measurement is not necessary.
