Low Power Indoor Access Point

AMNPTTX01

FCC ID: VQSAMNPTTX01

IC: 7680A-AMNPTTX01

This report concerns: Original Grant

Equipment type: FCC: Low Power Indoor Access Point (6ID)
IC: Wireless Local Area Network Device

Limits used: 47 CFR § 15.407, Section (a)(4-8)
IC: RSS-248, Issue 1, November 19, 2021,
RSS-Gen, Issue 5, April 2018

Measurement procedures used:

FCC: KDB 789033 D02 v02r01, ANSI C63.10:2013 and
KDB 987594
D02 U-NII 6GHz EMC Measurement v01
IC: RSS-248 Issue 1, RSS-Gen

1.2 List of Accreditations

The EMC laboratory of I.T.L. is accredited by the following bodies:

1. The American Association for Laboratory Accreditation (A2LA) (U.S.A.), Certificate No. 1152.01.
2. The Federal Communications Commission (FCC) (U.S.A.), FCC Designation No. IL1005.
3. Department of Innovation, Science and Economic Development (ISED) Canada, CAB identifier: IL1002

I.T.L. Product Testing Ltd. is accredited by the American Association for Laboratory Accreditation (A2LA) and the results shown in this test report have been determined in accordance with I.T.L.'s terms of accreditation unless stated otherwise in the report.

1.3 Product Description

Supply Voltage Range	5V _{DC} ± 10%
Mode of operation	Transceiver, two ports
Modulations	OFDM
Assigned Frequency Range	5925.0-7125.0
Operating Frequency Range	5925.0-6425.0
Total transmit power (conducted)	~14.0dBm (for 20MHz BW) ~18.0dBm (for 40MHz BW)
Antenna Gain	2.0dBi (dipole)
Modulation BW	20/40 MHz
EUT class	Low-Power indoor access point (6ID)

1.4 Test Methodology

Both conducted and radiated testing was performed according to the procedures in KDB 789003 D02 v02r01, KDB 987594 D02 U-NII 6GHz EMC Measurement v01 987594 D02 v01 and ANSI C63.10: 2013, and RSS-Gen Issue 5, March 2019, Amendment 1. Radiated testing was performed at an antenna to EUT distance of three meters.

1.5 Test Facility

Emissions tests were performed at I.T.L.'s testing facility in Lod, Israel. I.T.L.'s EMC Laboratory is accredited by the A2LA, certificate No. 1152.01 and its FCC Designation Number is IL1005.

2. System Test Configuration

2.1 Justification

1. The E.U.T. contains a 6 GHz band transceiver module that can transmit at two ports and in two optional BW's: 20 MHz and 40 MHz. Only Full Resource Unit (RU) configuration is supported.
2. The E.U.T. was tested at UNII5.
3. The unit was evaluated while transmitting at 20MHz BW in the low channel (5935.0 MHz), the mid channel (6175.0 MHz), and the high channel (6415.0 MHz), and at 40MHz BW in the low channel (5945.0 MHz), the mid channel (6185.0 MHz), and the high channel (6405.0MHz), each with duty cycle above 98%.
4. Conducted emission tests were performed with the E.U.T. antenna terminal connected by an RF cable to the Spectrum Analyzer, through an external attenuator.
5. Only for testing, the E.U.T. was powered by a typical AC/DC adapter.
6. As agreed upon with the customer and their TCB, Peak Power and PSD tests were performed on all Tx ports, and all other tests were performed on the highest power port.
7. Final radiated emission was performed for the two antenna types: dipole and PCB.

2.2 EUT Exercise Software

No special exercise software was used.

2.3 Special Accessories

No special accessories were used

2.4 Equipment Modifications

Customer reduced the power for each port to comply with the PSD limits.

4. Conducted Emission from AC Mains

4.1 Test Specification

FCC Part 15, Subpart C, Section 15.207

RSS-Gen, Issue 5, March 2019, Amendment 1, Section 8.8

RSS-248, Section 4.7.2(e)

4.2 Test Procedure

(Temperature (22°C)/ Humidity (56%RH))

The E.U.T. operation mode and test setup are as described in Section 2 of this report. In order to minimize background noise interference, the conducted emission testing was performed inside a shielded room, with the E.U.T. placed on a 0.8 meter high wooden table, 0.4 meter from the room's vertical wall. In the case of a floor-standing E.U.T., it was placed on the horizontal ground plane.

The E.U.T. was powered from 115 V AC / 60 Hz via 50 Ohm / 50 μ Hn Line Impedance Stabilization Network (LISN) on the phase and neutral lines. The LISN's were grounded to the shielded room ground plane (floor), and were kept at least 0.8 meters from the nearest boundary of the E.U.T.

The center of the E.U.T.'s AC cable was folded back and forth, in order to form a bundle less than 0.40 meters and a total cable length of 1 meter.

The effect of varying the position of the cables was investigated to find the configuration that produces maximum emission.

The emission voltages at the LISN's outputs were measured using a computerized receiver, complying with CISPR 16 requirements. The specification limits are loaded to the receiver and are displayed on the receiver's spectrum display.

The E.U.T. was evaluated in TX operation mode.

A frequency scan between 0.15 and 30 MHz was performed at 9 kHz I.F. band width, using peak detection.

The spectral components having the highest level on each line were measured using a quasi-peak and average detector.

4.3 Test Limit

Frequency of Emission (MHz)	Conducted Limit (dBμV)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

* Decreases with the logarithm of the frequency.

4.4 Test Results

JUDGEMENT: Passed by 9.00 dB

The margin between the emission levels and the specification limit is, in the worst case, -9.00 dB for the phase line at 24.022 MHz and -9.88 dB at 24.022 MHz for the neutral line.

The EUT met the FCC Part 15, Subpart C, and RSS-Gen, Issue 5, March 2019 Amendment 1 specification requirements.

The details of the highest emissions are given in *Figure 3* to *Figure 6*.

5.2 Test Procedure

(Temperature (20°C)/ Humidity (51%RH))

The E.U.T. operation mode and test set-up are as described in Section 2 of this report.

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable (total loss=32.5 dB). Special attention was taken to prevent Spectrum Analyzer RF input overload.

Spectrum setting done according KDB 789033, method SA-1 instructions.

5.3 Test Limit

For an indoor access point operating in the 5.925-7.125 GHz band the maximum e.i.r.p. over the frequency band of operation must not exceed 30 dBm.

5.4 Test Results

JUDGMENT: Passed by 9.1dB

The EUT met the requirements of the F.C.C. Part 15, Subpart E, Section 15.407(a) specifications.

(Temperature (22°C)/ Humidity (56%RH))

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable (loss = 34.5dB). The offset calculation: attenuator (30dB) + cable loss(2.5dB) E.U.T. gain antenna (2dBi) +=34.5dB. channel power over 1MHz used

7.3 Test Limits

For transmitters operating within the 5.925-7.125 GHz band: Any emissions outside of the 5.925-7.125 GHz band must not exceed an e.i.r.p. of -27 dBm/MHz.

FCC Part 15, Subpart E, Section 15.407(b)(1-7)
RSS-248, Issue 1, November 19, 2021, Section 4.7.2(a,c,d)

8.2 Test Procedure

(Temperature (22°C)/ Humidity (56%RH))

Testing was performed for both Radiated Emission for Emissions in the Non-Restricted Bands & in the Restricted Bands:

For measurements between 0.009-30MHz:

The E.U.T. was tested inside the shielded room and placed on a non-metallic table, 0.8 meters above the ground. The emissions were measured at a distance of 3 meters. The readings were maximized by the turntable azimuth between 0-360°, and the antenna polarization.

The frequency range 0.009MHz-30MHz was scanned.

For measurements between 30-1000MHz:

A preliminary measurement to characterize the E.U.T. was performed inside the shielded room at a distance of 3 meters, using peak detection mode and broadband antennas. The preliminary measurements produced a list of the highest emissions. The E.U.T. was then transferred to the open site, and placed on a remote-controlled turntable. The E.U.T. was placed on a non-metallic table, 0.8 meters above the ground. The emissions were measured at a distance of 3 meters. The readings were maximized by adjusting the antenna height between 1-4 meters, the turntable azimuth between 0-360°, and the antenna polarization. The frequency range 30MHz -1000MHz was scanned and the list of the highest emissions was verified and updated accordingly.

For measurements between 1GHz-40GHz:

The E.U.T. was tested inside the shielded room and placed on a non-metallic table, 1.5 meters above the ground. The emissions were measured at a distance of 3 meters. The readings were maximized by the turntable azimuth between 0-360°, and the antenna polarization.

The frequency range 1GHz - 40GHz was scanned.

Evaluation was performed for both 20 and 40MHz BW transmissions.

The highest radiations are described in the tables below.

*The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector. For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

8.6 Field Strength Calculation

The field strength is calculated directly by the EMI Receiver software, and a "Correction Factors", using the following equation:

$$FS = RA + AF + CF$$

FS: Field Strength [dB μ v/m]
 RA: Receiver Amplitude [dB μ v]
 AF: Receiving Antenna Correction Factor [dB/m]
 CF: Cable Attenuation Factor [dB]

Example: FS = 30.7 dB μ V (RA) + 14.0 dB (AF) + 0.9 dB (CF) = 45.6 dB μ V

No external pre-amplifiers are used.

12.1 Test Specification

KDB 987594 D02 U-NII 6GHz EMC Measurement v01
RSS-248 Issue 1 November 19, 2021, Section 4.8

12.2 Test Procedure

(Temperature (21°C)/ Humidity (54%RH))

Test procedure was performed according to Section I in KDB 987594.

Criteria for Pass: evacuation of channel when interferer was detected.

1. The E.U.T. was configured to transmit with a constant duty cycle at the power level, frequency, and BW listed in the results table.
2. An AWGN signal of 10 MHz-wide was generated and the AWGN power injected was calibrated to -60dBm at the EUT RF connector assuming 0dBi antenna gain
3. The setup shown below per KDB 617641 was connected to the setup.
4. The EUT was set to 20MHz BW and was set to transmit at 5935MHz, as shown in figure 105.
5. The AWGN signal was set to the center frequencies 5930MHz (according to table 1 of KDB987594 D02) at AWGN signal power of -85dBm (which is 25 dB below the -62 dBm threshold when assuming 0dBi antenna gain).
6. The AWGN signal source was turned ON.
7. The AWGN signal was increased until the EUT stopped transmission. The AWGN signal level is listed in the results table.
8. The procedure was repeated 10 times to verify the EUT can detect an AWGN signal at the same level.
9. The process was repeated for 40MHz BW performance: at the AWGN signal center frequencies of 5930MHz and 5960MHz for a 40MHz wide EUT signal transmitting at 5945MHz (according to table 1 of KDB987594 D02).
10. The procedure was repeated 10 times to verify the EUT can detect an AWGN signal at the same level.

12.3 Test Procedure Modification

Contention based protocol setup was done in link mode, which was approved by FCC in KDB 617641. The setup is shown in the following diagram.

12.4 Test Limit

Unlicensed low-power indoor devices must detect co-channel radio frequency power that is at least -62 dBm or lower. The -62 dBm (or lower) threshold is referenced to a 0 dBi antenna gain.

12.5 Test Results

EUT frequency	BW _{EUT}	Incumbent frequency	BW _{inc}	AWGN Power	Ant. gain	Adjusted AWGN Power	Detection Limit	Success no./Trial no.	Verdict

5945	40	5960	10	-65.5	2	-67.5	-62	10/10	pass

BW_{EUT}: Transmission bandwidth of EUT signal

BW_{inc}: Transmission bandwidth of the simulated incumbent signal (10 MHz wide AWGN signal)

f_{c1}: Center frequency of EUT transmission

f_{c2}: Center frequency of simulated incumbent signal

AWGN power: detection of incumbent signal and transmitter evacuated of the center frequency

AWGN Power was turned on at -85dBm. Therefore, there was no impact on transmission starting from -85dBm, which is 23dB below the defined threshold (-62dBm), assuming 0dBi antenna gain.

Minimal: this condition is not supported due to technical design

*Note: the E.U.T.'s antenna gain is 2 dBi, therefore the limit is -60dBm

JUDGEMENT: Pass

Criteria for Pass: evacuation of channel when interferer was detected

The channel was vacated at every trial.

The AWGN signal at 5930MHz that was detected for the 40MHz transmission at 5945MHz, was recorded in the plot below. See additional information in *Figure 70* to *Figure 72*

160	14.80
180	16.95
200	17.17

15.5 For ITL # 1349 Log Periodic Antenna

Frequency (MHz)	AF (dB/m)
200	11.58
250	12.04
300	14.76
400	15.55
500	17.85
600	18.66
700	20.87
800	21.15
900	22.32
1000	24.22

15.6 For ITL # 1352 1-18 Horn Antenna

Frequency (GHz)	AF (dB/m)		Frequency (GHz)	AF (dB/m)
0.75	25		9.5	38
1.0	23.5		10.0	38.5
1.5	26.0		10.5	38.5
2.0	29.0		11.0	38.5

8.5	38.0		17.5	42.0
9.0	37.5		18.0	42.5

15.7 For ITL # 1353 18-26.5 GHz Horn Antenna

Frequency (MHz)	Measured antenna factor dB/m
18000	32.4
18500	32.0
19000	32.3
19500	32.4
20000	32.3

Frequency (MHz)	Measured antenna factor dB/m
20500	32.8
21000	32.8
21500	32.7
22000	33.1
22500	33.0
23000	33.1
23500	33.8
24000	33.5
24500	33.5
25000	33.8
25500	33.9
26000	34.2
26500	34.7

The antenna factor shall be added to the receiver reading in dB μ V to obtain field strength in dB μ V/m.

15.8 For ITL # 1777 26.5-40 GHz Horn Antenna

15.9 For Horn Antenna Model: SWH-28

CALIBRATION DATA
