Test result

The requirements of the tests performed as shown in the overview (clause 4 of this test report) were fulfilled by the equipment under test.

The complete test results are presented in the following.

Test engineer:	Michael DINTER		08.04.2019
	Name	Signature	Date
Authorized reviewer:	Bernd STEINER		08.04.2019
	Name	Signature	Date

This test report is only valid in its original form.

The tests were carried out at:

PHOENIX TESTLAB GmbH
Königswinkel 10
32825 Blomberg
Germany

accredited by Deutsche Akkreditierungsstelle GmbH (DAkKS) in compliance with DIN EN ISO/IEC 17025 under Reg. No. D-PL-17186-01-02, FCC Test Firm Accreditation with the registration number 469623, designation number DE0004 and Industry Canada Test site registration SITE# IC3469A-1.

1.4 EUT (Equipment Under Test)

Type of equipment	Universal LCD touch device with integrated RF-card reader and printer interface
Product model name (PMN):*	uniFLOW Release Station PLUS (Rev. 2)
Model name (HVIN):*	uniFLOW Release Station PLUS (Rev. 2)
Order No.:	--
Serial No.:	606405394BC8
FCC ID:	WG7URSPLUS02
IC certification number:	7900A-URSPLUS02
PCB identifier:	--
Hardware version:	1.0
Software version (FVIN):	16.8.0
Lowest internal frequency:	125 kHz
Highest internal frequency:	720 MHz
Antenna type:	integral

*: declared by the applicant.

1.5 Technical data of equipment

RFID 125 kHz

Power supply: *	AC Adapter 120 V AC 60 Hz to 12 V DC GlobTek model GT-41080-1817.9-5.9		
Supply voltage AC Adapter: *	$U_{nom} = 120 \text{ V AC}$	$U_{min} = 100 \text{ V AC}$	$U_{max} = 240 \text{ V AC}$
Supply voltage EUT: *	$U_{nom} = 12 \text{ V DC}$	$U_{min} = 10 \text{ V DC}$	$U_{max} = 14 \text{ V DC}$
Supply voltage RFID module: *	USB 5 V DC stabilised (internal)		
Type of modulation: *	ASK, FSK, PSK (FSK was used for the test refer 2 operational states)		
Frequency deviation: *	$\pm 1000 \text{ Hz}$		
Operating frequency range: *	125 KHz		
Number of channels: *	1		
Antenna type: *	Internal loop antenna average loop area 2052 mm ²		
Duty cycle: *	100 %		
Rated RF power: *	< 250 mW		
Data rate: *	2.5 kBaud to 3.94 kBaud (FSK used 2.5 kBaud for the test)		
Temperature range: *	0 °C to +35 °C.		

* declared by the applicant.

RFID 13.56 MHz

Power supply: *	AC Adapter 120 V AC 60 Hz to 12 V DC GlobTek model GT-41080-1817.9-5.9		
Supply voltage AC Adapter: *	U _{nom} = 120 V AC	U _{min} = 100 V AC	U _{max} = 240 V AC
Supply voltage EUT: *	U _{nom} = 12 V DC	U _{min} = 10 V DC	U _{max} = 14 V DC
Supply voltage RFID module: *	USB 5 V DC stabilised (internal)		
Type of modulation: *	ASK		
Frequency deviation: *	± 1000 Hz		
Operating frequency range: *	13.56 MHz		
Number of channels: *	1		
Antenna type: *	Internal loop antenna average loop area 2385 mm ²		
Duty cycle: *	100 %		
Rated RF power: *	< 250 mW		
Data rate: *	26.4 kBaud to 106 kBaud		
Temperature range: *	0 °C to +35 °C.		

* declared by the applicant.

Ports / Connectors				
Identification	Connector		Length during test	Shielding (Yes / No)
	EUT	Ancillary

TAG 13.56 MHz:	HID iClass 13.56 MHz

Software used for the test	
Software	Device V1.0 Reader Orig. Firmware Version 16.8.0
Test Software	Yes

1.6 Dates

Date of receipt of test sample:	04.10.2018
Start of test:	22.10.2018
End of test:	30.10.2018

2 Operational states and test setup

Description of function of the EUT:

The EUT is a RFID System used for Print, Scan and Device Management.

The following states were defined as the operating conditions:

During the tests the EUT was powered with 12 VDC by the GlobTek model GT-41080-1817.9-5.9, which was itself supplied with 120 VAC / 60 Hz. The RFID reader part of the EUT was supplied by an internal stabilized 5 Volt USB port.

The tests were carried out with an unmodified sample, which continuously reading a TAG positioned in front of the EUT. Pre-tests were performed with and without reading a TAG. The worst case emissions were caused with the TAG in front of the reader.

Because the EUT could not identify two TAG's simultaneously, the tests were carried out reading either a 125 kHz (FSK modulation) or 13.56 MHz (ASK modulation) TAG.

As pre-tests have shown, reading a 13.56 MHz TAG causes higher emissions above 30 MHz. Therefore the tests above 30 MHz were carried out with this TAG

As pre-tests have shown different modulations kinds (FSK, PSK and ASK for different 125 kHz TAG's) causes no significant differences of the transmitter operating frequency ranges, modulation bandwidth and transmitter level. Therefore the tests were carried out with the 125 kHz TAG from HID PC Prox (FSK modulation) as representative set up. Only the outdoor test for the transmitter @ 125 kHz was carried out with all types of modulation.

Physical boundaries of the equipment

The physical boundaries of the EUT are shown below.

3 Additional information

Radiated emission tests repeated to document the differences between the original certified device and this variant as declared by the applicant.

4 Overview

Application	Frequency range [MHz]	FCC 47 CFR Part 15 section [2]	RSS-Gen, Issue 5 [4] and RSS-210, Issue 9 [3]	Status	Refer page
Conducted emissions on supply line	0.15 – 30	15.207 (a)	8.8 [4]	Not ordered by the applicant	-
Radiated emissions	0.009 – 5.000**	15.205 (a) 15.209 (a)	8.9, 8.10 [4] 4.1 [3]	Passed	10 et seq.
99 % bandwidth	13.56	-	6.7 [4]	Not ordered by the applicant	-
99 % bandwidth	0.125	-	6.7 [4]	Not ordered by the applicant	-
Antenna requirement	-	15.203 [2]	6.8 [4]	Passed *	-

*: Integrated antenna only, requirement fulfilled.

** : As declared by the applicant the highest internal frequency of 720 MHz was caused by the digital device the radiated emission measurement was carried out up to 5 GHz only.

5 Results

5.1 Radiated emissions

5.1.1 Method of measurement (radiated emissions)

The radiated emission measurement is subdivided into six stages.

- A preliminary measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 9 kHz to 1 GHz.
- A final measurement carried out on an outdoor test site without reflecting ground plane and a fixed antenna height in the frequency range 9 kHz to 30 MHz.
- A preliminary measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 30 MHz to 1 GHz.
- A final measurement carried out on an open area test site with reflecting ground plane and various antenna heights in the frequency range 30 MHz to 1 GHz.
- A preliminary measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 1 GHz to 40 GHz.
- A final measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 1 GHz to 40 GHz.

Preliminary measurement (9 kHz to 30 MHz):

In the first stage a preliminary measurement will be performed in a shielded room with a measuring distance of 3 meters. Table-top devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to [1].

The frequency range 9 kHz to 30 MHz will be monitored with a spectrum analyser while the system and its cables will be manipulated to find out the configuration with the maximum emission levels if applicable. The EMI Receiver will be set to MAX Hold mode. The EUT and the measuring antenna will be rotated around their vertical axis to found the maximum emissions.

The resolution bandwidth of the spectrum analyser will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	10 kHz

Preliminary measurement procedure:

Prescans were performed in the frequency range 9 kHz to 150 kHz and 150 kHz to 30 MHz.

The following procedure will be used:

- 1) Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
- 2) Manipulate the system cables within the range to produce the maximum level of emission.
- 3) Rotate the EUT by 360 ° to maximize the detected signals.
- 4) Make a hardcopy of the spectrum.
- 5) Measure the frequencies of highest detected emission with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
- 6) Repeat steps 1) to 5) with the other orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).
- 7) Rotate the measuring antenna and repeat steps 1) to 5).

Final measurement (9 kHz to 30 MHz):

In the second stage a final measurement will be performed on an open area test site with no conducting ground plane in a measuring distances of 3 m, 10 m and 30 m. In the case where larger measuring distances are required the results will be extrapolated based on the values measured on the closer distances according to Section 15.31 (f) (2) [2]. The final measurement will be performed with a EMI Receiver set to Quasi Peak detector except for the frequency bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where an average detector will be used according Section 15.209 (d) [2].

On the frequencies, which were detected during the preliminary measurements, the final measurement will be performed while rotating the EUT and the measuring antenna in the range of 0 ° to 360 ° around their vertical axis until the maximum value is found.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	9 kHz

Final measurement procedure:

The following procedure will be used:

- 1) Monitor the frequency range with the measuring antenna at vertical orientation parallel to the EUT at an azimuth of 0 °.
- 2) Rotate the EUT by 360 ° to maximize the detected signals and note the azimuth and orientation.
- 3) Rotate the measuring antenna to find the maximum and note the value.
- 4) Rotate the measuring antenna and repeat steps 1) to 3) until the maximum value is found.
- 5) Repeat steps 1) to 4) with the other orthogonal axes of the EUT (if the EUT is a module and might be used in a handheld equipment application).

Preliminary measurement (30 MHz to 1 GHz)

In the first stage a preliminary measurement will be performed in a fully anechoic chamber with a measuring distance of 3 meter. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to [1].

The frequency range 30 MHz to 1 GHz will be measured with an EMI Receiver set to MAX Hold mode and a resolution bandwidth of 120 kHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna and while rotating the EUT in its vertical axis in the range of 0 ° to 360 °.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
30 MHz to 1 GHz	120 kHz

Procedure preliminary measurement:

Prescans were performed in the frequency range 30 MHz to 1 GHz.

The following procedure will be used:

1. Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
2. Manipulate the system cables within the range to produce the maximum level of emission.
3. Rotate the EUT by 360 ° to maximize the detected signals.
4. Make a hardcopy of the spectrum.
5. Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
6. Repeat 1) to 4) with the other orthogonal axes of the EUT if handheld equipment.
7. Repeat 1) to 5) with the vertical polarisation of the measuring antenna.

Final measurement (30 MHz to 1 GHz)

A final measurement on an open area test site will be performed on selected frequencies found in the preliminary measurement. During this test the EUT will be rotated in the range of 0 ° to 360 °, the measuring antenna will be set to horizontal and vertical polarisation and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
30 MHz to 1 GHz	120 kHz

Procedure final measurement:

The following procedure will be used:

- 1) Measure on the selected frequencies at an antenna height of 1 m and a EUT azimuth of 23 °.
- 2) Move the antenna from 1 m to 4 m and note the maximum value at each frequency.
- 3) Rotate the EUT by 45 ° and repeat 2) until an azimuth of 337 ° is reached.
- 4) Repeat 1) to 3) for the other orthogonal antenna polarization.
- 5) Move the antenna and the turntable to the position where the maximum value is detected.
- 6) Measure while moving the antenna slowly +/- 1 m.
- 7) Set the antenna to the position where the maximum value is found.
- 8) Measure while moving the turntable +/- 45 °.
- 9) Set the turntable to the azimuth where the maximum value is found.
- 10) Measure with Final detector (QP and AV) and note the value.
- 11) Repeat 5) to 10) for each frequency.
- 12) Repeat 1) to 11) for each orthogonal axes of the EUT if handheld equipment.

Preliminary and final measurement (1 GHz to 110 GHz)

This measurement will be performed in a fully anechoic chamber. Table top devices will set up on a non-conducting turn device on the height of 1.5 m. The set-up of the Equipment under test will be in accordance to [1].

Preliminary measurement (1 GHz to 110 GHz)

The frequency range will be divided into different sub ranges depending of the frequency range of the used horn antenna. The spectrum analyser set to MAX Hold mode and a resolution bandwidth of 100 kHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna and while rotating the EUT in its vertical axis in the range of 0 ° to 360 °. This measurement is repeated after raising the EUT in 30 ° steps according 6.6.5.4 in [1].

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
1 GHz to 4 GHz	1 MHz
4 GHz to 12 GHz	1 MHz
12 GHz to 18 GHz	1 MHz
18 GHz to 26.5 GHz	1 MHz
26.5 GHz to 40 GHz	1 MHz
40 GHz to 60 GHz	1 MHz
50 GHz to 75 GHz	1 MHz
75 GHz to 110 GHz	1 MHz

Procedure preliminary measurement:

Prescans were performed in the frequency range 1 to 40 GHz.

The following procedure will be used:

1. Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0°.
2. Rotate the EUT by 360° to maximize the detected signals.
3. Repeat 1) to 2) with the vertical polarisation of the measuring antenna.
4. Make a hardcopy of the spectrum.
5. Repeat 1) to 4) with the EUT raised by an angle of 30° (60°, 90°, 120° and 150°) according to 6.6.5.4 in [1].
6. Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
7. The measurement antenna polarisation, with the according EUT position (Turntable and Turn device) which produces the highest emission for each frequency will be used for the final measurement. The six closest values to the applicable limit will be used for the final measurement.

Final measurement (1 GHz to 110 GHz)

The frequency range will be divided into different sub ranges depending of the frequency range of the used antenna. The EMI Receiver set to peak and average mode and a resolution bandwidth of 1 MHz. The measurement will be performed by rotating the turntable through 0 to 360° in the worst-case EUT orientation which was obtained during the preliminary measurements.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
1 GHz to 4 GHz	1 MHz
4 GHz to 12 GHz	1 MHz
12 GHz to 18 GHz	1 MHz
18 GHz to 26.5 GHz	1 MHz
26.5 GHz to 40 GHz	1 MHz
40 GHz to 60 GHz	1 MHz
50 GHz to 75 GHz	1 MHz
75 GHz to 110 GHz	1 MHz

Procedure of measurement:

The measurements were performed in the frequency range 1 GHz to 110 GHz.

The following procedure will be used:

- 1) Set the turntable and the turn device to obtain the worst-case emission for the first frequency identified in the preliminary measurements.
- 2) Set the measurement antenna polarisation to the orientation with the highest emission for the first frequency identified in the preliminary measurements.
- 3) Set the spectrum analyser to EMI mode with peak and average detector activated.
- 4) Rotate the turntable from 0° to 360° to find the EUT angle that produces the highest emissions.
- 5) Note the highest displayed peak and average values
- 6) Repeat the steps 1) to 5) for each frequency detected during the preliminary measurements.

5.1.2 Test results (radiated emissions)

5.1.2.1 Preliminary radiated emission measurement 9 kHz to 1 GHz

Ambient temperature	22 °C	Relative humidity	62 %
---------------------	-------	-------------------	------

Position of EUT: The EUT was set-up on a non-conducting table.

Cable guide: The cables of the EUT were fixed on the non-conducting table. For further information of the cable guide refer to the pictures in annex A of this test report.

Test record: The test was carried out reading a TAG continuously (refer also clause 2 of this test report). The tests were carried out in normal positions as declared by the applicant.

Power supply: During this test the EUT was powered with 12 V_{DC} by the GlobTek model GT-41080-1817.9-5.9, which was itself supplied by an AC mains Network with 120 V_{AC} / 60 Hz.

Frequency range: According to [2] from 9 kHz to 1 GHz.

181775 with 125 kHz NFC NTTAG.Rtf: Emissions from 9 kHz to 30 MHz reading a 125 kHz TAG

The following emissions were found according to [2] and [3].

Frequency (MHz)
0.043600*
0.086500*
0.125000
0.165000*

Remark*: These frequencies has to be not rated because they were caused by the digital device also as seen in the plot of the Emissions from 9 kHz to 30 MHz reading a 13.56 MHz TAG.

These frequencies have to be measured on the outdoor test site. The result is presented in the following.

181775 with 13.56 MHz NFC NTAG 203.Rtf: Emissions from 9 kHz to 30 MHz reading a 13.56 MHz TAG

The following emissions were found according to [2] and [3].

Frequency (MHz)
0.042700*
0.084700*
0.165000*
13.560000

Remark*: These frequencies has to be not rated because they were caused by the digital device also as seen in the plot of the Emissions from 9 kHz to 30 MHz reading a 125 kHz TAG.

These frequencies have to be measured on the outdoor test site. The result is presented in the following.

181775_30-1000MHz_FCC15.209.Rtf: Emissions from 30 MHz to 1000 MHz reading a 13.56 MHz TAG

Remark: As pre-test have shown, reading a 13.56 MHz TAG causes higher emissions above 30 MHz. Therefore the tests above 30 MHz were carried out with this TAG

The following frequencies were found emission test outside and inside restricted bands during the preliminary radiated:

Frequency (MHz)
40.680000
62.502000
75.000000
87.510000
324.996000
325.008000
375.024000
424.992000
475.014000
475.032000
625.008000
675.030000
725.082000
825.018000
925.014000

These frequencies have to be measured on the open area test site. The results were presented in the following.

Test equipment used (refer clause 6)

1- 8

5.1.2.2 Preliminary radiated emission measurement 1 GHz to 5 GHz

Ambient temperature	22 °C	Relative humidity	48 %
---------------------	-------	-------------------	------

Position of EUT: The EUT was set-up on a non-conducting table.

Cable guide: The cables of the EUT were fixed on the turn device. For further information of the cable guide refer to the pictures in annex A of this test report.

Test record: The test was carried out reading a TAG continuously (refer also clause 2 of this test report). The tests were carried out in normal positions as declared by the applicant.

Power supply: During this test the EUT was powered with 12 V_{DC} by the GlobTek model GT-41080-1817.9-5.9, which was itself supplied by an AC mains Network with 120 V_{AC} / 60 Hz.

Frequency range: According to [2] from 1 GHz to 5 GHz.

181775 1-5GHz FCC15.209.Rtf: Emissions from 1 GHz to 5 GHz reading a 13.56 MHz TAG

— PK+_MAXH — FCC 15_209 AH PK — FCC 15_209 AHAV

Remark: As pretest has shown, reading a 13.56 MHz TAG causes higher emissions above 30 MHz. Therefore the tests above 30 MHz were carried out with this TAG

The following frequencies were found emission test outside and inside restricted bands during the preliminary radiated:

Frequency (MHz)
1125.000000
1174.914286
1224.257143
1274.257143
1488.057143
1584.057143
1968.085714

On these frequencies a final measurement has to be carried out. The results were presented in the following.

Test equipment used (refer clause 6)

9 - 20

5.1.2.3 Final radiated emission measurement from 9 kHz to 30 MHz

Ambient temperature	10 °C	Relative humidity	72 %
---------------------	-------	-------------------	------

Position of EUT: The EUT was set-up on a non-conducting table.

Cable guide: The cables of the EUT were fixed on the non-conducting table. For further information of the cable guide refer to the pictures in annex A of this test report.

Test record: The test was carried out reading a TAG continuously (refer also clause 2 of this test report). The tests were carried out in normal positions as declared by the applicant.

Power supply: During this test the EUT was powered with 12 V_{DC} by the GlobTek model GT-41080-1817.9-5.9, which was itself supplied by an AC mains Network with 120 V_{AC} / 60 Hz.

Test results: The test results were calculated with the following formula:

Reading a 125 kHz TAG

Frequency	Reading	Result*	Limit acc. 15.209	Margin	Detector (acc to §15.209 (d))	Antenna factor	Measuring Distance	Distance corection factor**

Remark***: These frequencies has to be not rated because they were caused by the digital device also as seen in the plot of the emissions from 9 kHz to 30 MHz reading a 125 kHz TAG.

Test: Passed

Test equipment used (refer clause 6)

21 - 23

5.1.2.4 Final radiated emission measurement from 30 MHz to 1 GHz

Ambient temperature	6 °C	Relative humidity	55 %
---------------------	------	-------------------	------

Position of EUT:	The EUT was set-up on a non-conducting table.
Cable guide:	The cables of the EUT were fixed on the non-conducting table. For further information of the cable guide refer to the pictures in annex A of this test report.
Test record:	The test was carried out reading a TAG continuously (refer also clause 2 of this test report). The tests were carried out in normal positions as declared by the applicant.
Power supply:	During this test the EUT was powered with 24 V _{DC} by the GlobTek model GT-41080-1817.9-5.9, which was itself supplied by an AC mains Network with 120 V _{AC} / 60 Hz.
Remark:	As pretest has shown, reading a 13.56 MHz TAG causes higher emissions above 30 MHz. Therefore the tests above 30 MHz were carried out with this TAG
Test results:	The test results were calculated with the following formula: Result [dBμV/m] = reading [dBμV] + antenna factor [dB/m]

The measured points and the limit line in the following diagrams refer to the standard measurement of the emitted interference in compliance with the above-mentioned standard. The measured points marked with an ◆ are the measured results of the standard final measurement on the open area test site.

The results of the standard subsequent measurement on the open area test site are indicated in the table below. The limits as well as the measured results (levels) refer to the above mentioned standard while taking account of the specified requirements for a 3 m measuring distance. The measurement time with the quasi-peak measuring detector is 1 seconds.

Final Result

Measurement uncertainty ± 4.78 dB									

Result: Passed

Test equipment used (refer clause 6)

1, 24 - 29

5.1.2.5 Final radiated emission measurement from 1 GHz to 5 GHz

Ambient temperature	22 °C	Relative humidity	62 %
---------------------	-------	-------------------	------

Position of EUT: The EUT was set-up on a turn device.

Cable guide: The cables of the EUT were fixed on the turn device. For further information of the cable guide refer to the pictures in annex A of this test report.

Test record: The test was carried out reading a TAG continuously (refer also clause 2 of this test report). The tests were carried out in normal positions as declared by the applicant.

Power supply: During this test the EUT was powered with 12 V_{DC} by the GlobTek model GT-41080-1817.9-5.9, which was itself supplied by an AC mains Network with 120 V_{AC} / 60 Hz.

Remark: As pretest has shown, reading a 13.56 MHz TAG causes higher emissions above 30 MHz. Therefore the tests above 30 MHz were carried out with this TAG

Frequency range: According to [2] from 1 GHz to 5 GHz.

Final Result

Frequency (MHz)	MaxPeak (dBμV/m)	CAverage (dBμV/m)	Limit (dBμV/m)	Margin (dB)	Pol	Azimuth (deg)	Elevation (deg)	Corr. (dB)
