4. Operation and Monitoring of the EUT during Testing

4.1. Operating Modes

The EUT was tested in the following operating mode(s):

☒ Transmitting Mode (Fixed Frequency Mode) ☒ Transmitting Mode (Frequency Hopping Mode)

4.2. Configuration and Peripherals

The EUT was tested in the following configuration(s):

- The EUT was powered by 120 V AC 60Hz power supply.
- The test mode settings were activated using a software application ReaderStart V3, rev.3.01.03.2531 on the laptop PC supplied by the customer. The application was used to enable continuous transmission and to select the test channels as required.
- EUT was tested with maximum output power in both fixed channel frequencies and in hopping channels mode.
- EUT's unused ports (Port 1 | Port 3 | Port 4) were terminated using 50 Ohm termination during testing.
- For Conducted tests EUT's test port (Port 2) was connected to spectrum analyzer. The measured values takes into consideration the external attenuation correction factors. The RF cable attenuation from the EUT to Analyzer including the 10 dB attenuation at the Spectrum Analyzer input was added as a reference level offset (10.2 dB) to each of the conducted plots.
- For Radiated tests EUT's test port (Port 2) was connected to Antenna using RF cable supplied by the customer. This cable introduced a loss of 1dB @ 902-928MHz. This has been taken in to account with the measured radiated values."
- EUT supports three data rates (40 kbps / 80 kbps/160 kbps) out of which worst case (40 kbps) data rate producing maximum peak power has been tested.
- All the supplied antennas as given in section 3.5 have been tested. It is to be noted that the WIRA-70-KRAI -FCC Antenna supports several polarizations (LHCP/ RHCP & HP/ VP) and all the supported polarisations have been tested.

4.3. Used Power settings

The EUT was configured with the settings below based on the different antenna type. The antenna gain on the GUI was set to 0 dBi and Cable attenuation was set to 0 dB.

The port power settings selected in GUI is given as in the table below.

5. Measurements, Examinations and Derived Results

5.1. General Comments

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to Section 6 *Measurement Uncertainty* for details.

In accordance with DAkkS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

Test Method Used:	ANSI C63.10 Section 7.8.5

Environmental Conditions:

Temperature (°C):	24
Relative Humidity (%):	48

Notes:

6. Measurement Uncertainty

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

Measurement Type	Confidence Level (%)	Calculated Uncertainty
AC Conducted Spurious Emissions	95%	± 2.49 dB
Conducted Maximum Peak Output Power	95%	± 0.59 dB
Conducted Spurious Emissions	95%	± 0.59 dB
Band Edge Radiated Emissions	95%	± 3.10 dB
Carrier Frequency Separation	95%	± 92 Hz
Average Time of Occupancy	95%	± 3.53 ns
20 dB Bandwidth	95%	± 0.87 %

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.
